Arvin GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 2 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Table 1. (Glide Path – Target Deficit Reduction)

Kern County Subbasin Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		Project and Management Action Implementation Schedule (AFY)

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Arvin GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for Arvin GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (8,693 AFY) of the projected deficit of 34,770 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2030.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example AE-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description			Relevant Sustainability Indicators			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits							Source(s) of Water	Legal Authority Required	Estimated Costs		
					Groundwater Levels & Storage	Groundwater Quality	Land Subsidence								Primary (AFY)		Secondary							One-time Costs	Ongoing Costs (per year)	Potential Funding Source(s)
															Water Supply Augmentation	Demand Reduction	Water Quality Improvement	Flood Control	Water Management Flexibility or Efficiency	Mitigation Programs	Data Gap Filling/Monitoring					
<i>Projects</i>		Implemented	Functional	In-Process	As-Needed								Implemented	Functional	In-Process	As-Needed										
AE-1	ACSD Well #12 Construction	This project would drill a new well to replace a well that is considered at risk of contamination due to its proximity to the Brown and Bryant Superfund Site. The new well (No. 12) is being drilled concurrently with the Arsenic Mitigation Project Phase II and will allow ACSD to bring four new wells online in addition to Well No. 13 and 14 brought online in July of 2016.			✓			Underway	Public meetings, direct mail	Title 22 Drinking Water Regulations	Complete	Complete	2019-	0	0	✓					NA	None	\$2,250,000	NA	ACSD	
AE-2	On-Farm Recharge	The program encourages individual growers to perform on-farm recharge for individual and aggregated benefits. Water may be recharged on-farm in private basins and/or distributed through irrigation systems across irrigated acreage in excess of current crop ET.			✓			Supplemental Water Recharge	Underway	No public notice required for implementation; outreach and education will expand program.	NA	Starting in 2023, provided financial incentives to landowners to conduct on-farm recharge; 13,317 AF recharged to the Kern Subbasin in 2023.	Ongoing; implemented beginning in 2019	2023-	5300	0	✓	✓	✓		Local stormwater	None	NA	NA	Private; if required	
AE-3	Emergency 1,2,3-TCP Treatment Well #12 (EPA Replacement CW-1)	The project involves the installation of emergency 1,2,3-TCP treatment at the well head. The work will include installation of a skid mounted treatment system with two granular activated carbon media vessels for removal of 1,2,3-TCP, connection to the existing well discharge piping, installation of below ground and above ground influent and effluent piping and appurtenances, electrical and controls, and modifications to the existing well site PLC programming.			✓			Underway	Public meetings, direct mail	Title 22 Drinking Water Regulations	Well #12 was completed and commissioned in May of 2021.	Completed May 2021	2021-	0	0	✓					NA	None	\$1,600,000	TBD	ACSD	
AE-4	Forrest Frick Pipeline / KDWD Eastside Canal Intertie	This project connects the Forrest Frick Pipeline to the KDWD Eastside Canal to send AEWSD S/W supplies through KDWD to serve portions of the AEWSD G/W/SA with temporary water contracts, utilizing existing infrastructure (turnouts, pipelines that are both District and landowner owned). With the District's new 9(d) contract, certain provisions of Reclamation law are no longer applicable and all lands within the service area can now be served with federal water supplies.			✓	✓		Supplemental Water Use	Underway	Infrastructure improvement; no public noticing necessary	CEQA; NEPA; County encroachment permits	Deliveries began in February 2023	Construction completed in February 2023	2023-	1,900	0	✓	✓	✓		Additional wet-year imported water supplies	None	\$1,000,000	TBD	AEWSD General Fund, USBR grant	
AE-5	Arsenic Mitigation Project - Phase II	The purpose of the project is to bring the ACSD water system into compliance for Arsenic. All five of the ACSD active wells exceed the maximum contaminant level (MCL) of 10 ppb for Arsenic. The project was separated into two phases. Phase II involves drilling three new wells, constructing a 1.0 MG storage tank and booster pumping plant, and connecting the facilities to the existing distribution system. The original five (5) water wells will then be abandoned and destroyed in accordance with Kern County Standards.			✓			Underway	Public meetings, direct mail	Title 22 Drinking Water Regulations	Well #18 completed December 2023; all other project components complete	December 2023	2024-	0	0	✓				NA	None	\$14,200,000	TBD	ACSD		
AE-6	Private & Caltrans Basin Connections	This project involves the construction of pipelines to connect several on-farm private basins and Caltrans sumps near AEWSD to utilize for groundwater recharge.			✓			Supplemental Water Recharge	Grant funding	Infrastructure improvement; no public noticing necessary	Caltrans permitting; CEQA if longer pipeline connections are required	Several Cal Trans basins have been connected to AEWSD and are currently taking surface water for recharge	Ongoing	2023-	270	0	✓	✓	✓		Additional wet-year imported water supplies; Local stormwater	None	\$500,000	NA	AEWSD General Fund; grants	

AE-31	Exercising Existing Water Rights	The USBR, SLDMWA, FWA, and SJREC have entered into a MOU to collectively identify projects and potential actions aimed at improving drought resiliency south of the Delta, including AEWSD deliveries from the FKC. The South of Delta Drought Resiliency Framework allows participating entities to voluntarily conserve and securely store a portion of their CVP south of Delta deliveries for subsequent use with the goal of providing at least a 5% allocation to CVP south of Delta agricultural water service/repayment contracts, reducing reliance on Delta exports in drought years.	✓			Exercise of Rights	Underway	NA	NA	MOU effective March 2024	2024	2024-	2000	0	✓				Increased reliability of AEWSD's CVP supplies	Signed MOU	\$0	\$0	AEWSD General Funds
AE-8	AEWSD Sunset Spreading Works	The Sunset Spreading Works, approximately 150 acres, is located on the boundary between AEWSD and KDWD, adjacent to KDWD's Eastside Canal. The Project takes surface water (Federal CVP, State Water Project, or local supplies) diverted through KDWD's Eastside Canal and recharges the surface supplies as part of AEWSD's and KDWD's joint water management programs. The Project included the construction of exterior and interior dikes for a direct recharge facility, a new turnout and pump station from the KDWD Eastside Canal, and interbasin structures.	✓	✓		Supplemental Water Recharge	Underway	Infrastructure improvement; no public noticing necessary	KDWD encroachment permit; CEQA; NEPA if federal funds are used	Project construction is anticipated to be complete in Spring 2024; Early deliveries began in February 2023 using mobile temporary pumps	Spring 2024	2023-	4920	410	✓	✓	✓		Additional wet-year imported water supplies	None	\$7,330,000	TBD	AEWSD General Fund (50%), KDWD (50%)
AE-9	DiGiorgio Unit In-Lieu Storage Program	The District will supply SW when available through new facilities to the GWSA to meet its water requirements with the intent of reducing District-wide G/W use. However, when SW is in short supply and under agreement, the landowners could recover and return G/W from their own wells to the District canal system through new pipelines once they have satisfied their own water needs.	✓	✓		Supplemental Water Use	Grant funding	Infrastructure improvement; no public noticing necessary	CEQA; NEPA requirements if grant funds are used; PWRPA; possible Kern County encroachment permits	Phase 2a construction anticipated to be complete in Fall 2024; funded through portion of a \$25M loan to AEWSD	Phase 2a completion: Fall 2024	2025-	4250	0	✓			Additional wet-year imported water supplies	None	\$17,000,000	TBD	AEWSD General Fund	
AE-10	Frick Unit In-Lieu Project	This project would increase the ability of the District to provide surface water supplies to the Groundwater Service Area (GWSA) to help meet crop irrigation requirements. With the Project, the District will supply surface water when available through new facilities to the GWSA to meet crop irrigation requirements with the intent of reducing District wide groundwater use.	✓	✓		Supplemental Water Use	Grant funding	Infrastructure improvement; no public noticing necessary	CEQA; NEPA requirements if grant funds are used; PWRPA; possible Kern County encroachment permits	\$2M from the IRWM Round 2 grant awarded	2025	2026-	3500	0	✓			Additional wet-year imported water supplies	None	\$16,000,000	TBD	AEWSD General Fund, IRWM Grant	
AE-11	Expansion of North Canal Spreading Works	The Project will convert approximately 160 acres of permanently cropped agricultural lands into additional groundwater recharge facilities as part of the District's existing North Canal Spreading Works. The Project water supply benefits include approximately 500 AFY due to the land use change (vineyards and almond orchards to basins), plus an average annual recharge benefit of 5,200 AFY (or 13,000 AF in an unconstrained year).	✓	✓		Supplemental Water Recharge	Underway	CEQA, NEPA	CEQA, NEPA	Planning and design underway; construction anticipated to begin in October 2025 and last 6 months	2025	2026-	5200	500	✓	✓	✓	Additional wet-year imported water supplies	None	\$4,300,000	TBD	AEWSD General Fund; DWR grant	
KSB-1	Friant-Kern Canal Capacity Mitigation	1) Collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction, 2) develop an attribution analysis of post-2020 subsidence impacts, 3) participate in developing a value of water analysis in cooperation with FWA and 4) develop and implement a funding mechanism to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.	✓	✓			Completion of Design and Impact Analysis	Stakeholder Meetings Board Meetings	NA	Feasibility Study	2030	2030-	0	0		✓	✓	NA	None	Unknown	Unknown	AEWSD General Fund (Study only)	
AE-12	AEWSD South Canal Flood Study / Improvements	The South Canal Flood Study would review and possibly revise the FEMA floodplain in this area in order to increase the height of the canal bank to provide additional operational freeboard and accordingly reduce the potential for canal spills and subsequent flooding. The additional canal storage could allow for the capture and use of additional floodwater in-lieu of groundwater pumping.	✓			New Local Supply	Grant funding	Infrastructure improvement; no public noticing necessary	NA	Initiated the South Canal Flood Study, including identification of potential grant funding sources	Study approx. 1 year; construction approx. 1 year	2030-	150	0	✓	✓		Local stormwater	None	\$2,300,000	NA	AEWSD General Fund	
AE-13	Conversion of Granite Quarry to Sycamore Ranch	The Granite Co. quarry, located upstream of the Sycamore Spreading Basins, is approaching the end of its operational life and could be converted into a balancing / detention / spreading reservoir. Excess flows in the North Canal could be pumped into the quarry reservoir, so the detained water could be recirculated for irrigation demands in-lieu of groundwater pumping and/or recharged.	✓	✓		Supplemental Water Use	To be implemented upon adoption of GSP / Grant funding	Infrastructure improvement; no public noticing necessary	CEQA; DMR SMARA permit closure; NEPA requirements if grant funds are used	Geotechnical study complete; AEWSD and TCWD have participated in several meetings to discuss the permitting process for this project	Construction duration TBD	2030-	0	0	✓	✓		Additional wet-year imported water supplies	Property acquisition or land use agreement with quarry owner	\$15,000,000	TBD	AEWSD General Fund, TCWD	

AE-14	AEWSD Wasteway Basin Improvements	The primary use of the existing AEWSD Wasteway Basin is to provide emergency water storage in the event of power failure. Additionally, it works as a detention facility for the City of Bakersfield stormwater. This project would include construction of a HDPE liner along the levees, installation of recirculation pumps, and basin grading. These improvements would allow the basin to serve as a location to divert and clarify sediment.	✓			New Local Supply	Project to be implemented upon FEMA grant approval.	Infrastructure improvement; no public noticing necessary	SJVAPCD Dust Control & SWPPP; NEPA Cultural Resources	AEWSD continues to seek grant funding for this project.	Construction duration: 3 years	2040-	1550	0	✓	✓			Stormwater from Bakersfield storm sewer system	None	\$2,500,000	\$32,000	AEWSD General Fund
AE-15	General In-Lieu Storage Program	The In-Lieu Banking Program consists of supplying surface water to landowners that previously relied only on groundwater (GW/SA). New infrastructure would have to be built to facilitate the implementation of this program.	✓	✓		Supplemental Water Use	Grant funding	Infrastructure improvement; no public noticing necessary	CEQA; NEPA requirements if grant funds are used; PWRPA; possible Kern County encroachment permits	Imported and delivered surface water to contracted and noncontracted lands; Sandrini Unit (i.e., Tejon Expansion) under design; Development of a potential hybrid in-lieu and temporary water service contract is underway and landowner outreach for the new areas will begin soon.	2030	2030-	15000	110	✓			Additional wet-year imported water supplies	None	\$10,000,000	TBD	AEWSD General Fund	
AE-32	Capture of Imported Water Return Flows from White Wolf Subbasin	AEWSD has provided imported water deliveries to landowners within the White Wolf Subbasin. Return flows of imported water flow across the White Wolf Fault into Arvin GSA. Arvin GSA would capture the proportion of Subbasin inflows attributed to AEWSD's imported water return flows for distribution and use within the surface water service area.	✓			Exercise of Rights	Underway	GSA Board meetings	NA	Arvin GSA has initiated discussions and negotiations with Subbasin GSAs and White Wolf GSA	2025	2025-	4500	0				Imported water return flows	None	\$0	\$0	NA	
AE-16	Sycamore Creek Detention & Sedimentation Basin	The proposed basin would serve to intercept sediment from Sycamore creek flows to prevent constriction where sediment deposits downstream, reduce the peak outflow, and prevent the likelihood of a canal and spreading basing breach. Detained water could be recirculated for irrigation demands or recharged for groundwater supply augmentation.	✓	✓		Supplemental Water Recharge	Grant funding	Infrastructure improvement; no public noticing necessary	County grading permit; NEPA if federal grant funds used; SMARA (potentially)	Not yet Initiated	Construction duration: approx. 2 years	1-3 years after construction	250	0	✓			Local stormwater	None	\$3,000,000	\$30,000	AEWSD; potential grants	
AE-17	Stormwater Management and Flood Control Improvements	Potential construction of new sedimentation/detention basins, flood ditch erosion protection, Spillway Basin expansion, lengthening the South Canal's siphon under David Road or extension of the South Canal liner through designated floodplain reaches.	✓	✓		Supplemental Water Recharge	Grant funding and completion of feasibility study	Infrastructure improvement; no public noticing necessary	Permits: TBD; NEPA requirements if funds are granted	Not yet Initiated	Construction duration: approx. 1 year	1-3 years after construction	TBD	0	✓	✓		Local stormwater	None	TBD	TBD	AEWSD and partnering agencies	
AE-18	Caliente Creek Habitat Mitigation and Groundwater Recharge	Restoration of agricultural lands to native vegetation to provide flood mitigation. Two alternatives are being considered, of which Alternative 1 is partial agricultural and 2 is non-agricultural.	✓			Supplemental Water Recharge; Land Retirement	Grant funding	CEQA, NEPA	CEQA; NEPA (if federal funds used); SWRCB Waste Discharge Requirements; CDFW Agreement; Determination of consistency with VFHCP	Not yet Initiated	TBD	Immediately following construction	TBD	TBD	✓			Local stormwater	None	\$3,000,000	TBD	AEWSD; potential grants	
AE-19	AEWSD Intake Canal / KDWD Farmer's Canal Intertie	Improvement of existing and/or construction of new interties between AEWSD Intake Canal and KDWD's Farmer's Canal to facilitate water exchanges between the two districts and Kern County partners.	✓			Supplemental Water Use	Completion of feasibility study	Infrastructure improvement; no public noticing necessary	None (CEQA exempt under 15301 and 15303)	Not yet Initiated	Construction duration: approx. 1 year	1 year after construction	4000	0		✓		Additional wet-year imported water supplies	None	\$2,000,000	\$20,000	AEWSD General Fund; KDWD	
AE-20	AEWSD North Canal Balancing Reservoir Expansion & Discharge Pipelines	The proposed project will consist of the installation of a pipeline system that will convey flows from the four (4) wells within the AEWSD Balancing Reservoir directly to the basin discharge structure and no longer through the basin low flow channels. Infiltration and evaporation losses on well discharge flows will be eliminated and power efficiency for the wells (kwh/af) will be significantly enhanced since all water pumped will be discharged into the North Canal.	✓			Supplemental Water Recharge; Demand Reduction	Completion of feasibility study	Infrastructure improvement; no public noticing necessary	None	Not yet Initiated	Construction duration TBD	1-3 years after construction	100	40		✓		Additional wet-year imported water supplies	None	\$300,000	TBD	AEWSD; potential grants	

AE-21	AEWSD Lateral Capacity Improvement Projects	Increase delivery capacity of the AEWSD N-55 lateral system. Some examples of the actions considered for this project are: replacement of lateral system and landowner pipelines, renovation of storage tanks, construction of pump stations, etc.	✓			Supplemental Water Use	Grant funding/Completion of feasibility study	Infrastructure improvement; no public noticing necessary	Permits: TBD; NEPA requirements if funds are granted	Not yet Initiated	Construction duration TBD	TBD	1000	0				Additional wet-year imported water supplies	None	\$15,000,000	TBD	AEWSD General Fund	
AE-22	AEWSD South Canal Balancing Reservoir	Creation of a reservoir to allow water storage for flow mismatches in the AEWSD canal system during operation or emergencies. Depending on the location, this reservoir would increase storage capacity by ~500 AF.	✓			Supplemental Water Use	Grant funding, South County flooding response	Infrastructure improvement; no public noticing necessary	TBD	Not yet Initiated	Construction duration TBD	TBD	500	190				Additional wet-year imported water supplies	None	\$5,000,000	\$5,000	AEWSD General Fund	
AE-23	Reclamation of Oilfield Produced Water	Reclaiming water from oil production facilities for irrigation purposes is currently an untapped water source in AEWSD. After treatment and cooling, produced water could be pumped into AEWSD facilities to serve irrigation demands in-lieu of groundwater pumping.	✓	✓		New Local Supply	To be implemented upon adoption of GSP / agreement with partnering oil field	Public meetings	TBD	Not yet Initiated	TBD	1 year after agreement	1000	0				Oil field produced water	None	TBD	TBD	AEWSD and partnering oilfield	
AE-24	Wastewater Reclamation with City of Arvin & Bakersfield	Reclaiming water from Cities of Arvin and Bakersfield wastewater treatment facilities for irrigation purposes is currently an untapped water source in AEWSD. After wastewater treatment, the effluent could be pumped into AEWSD facilities to serve irrigation demands in-lieu of groundwater pumping.	✓			New Local Supply	To be implemented upon adoption of GSP / agreement with City of Arvin and City of Bakersfield	Public meetings	City encroachment permits; SWRCB Waste Discharge Requirements	Not yet Initiated	TBD	1 year after agreement	10000	0				Wastewater from Cities of Arvin and Bakersfield	None	TBD	TBD	AEWSD and partnering cities

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 34,770 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented or in-process** that contribute to water demand reduction include:

AE-7 Sunset Spreading Works = The Sunset Spreading Works is approximately 150 acres, located on the boundary between the Arvin-Edison Water Storage District (AEWSD) and Kern Delta Water District (KDWD), adjacent to KDWD's Eastside Canal. Through conversion of 150 acres of irrigated lands to the a spreading works facility, approximately 410 AFY of demand reduction will occur due to the land use change (vineyards to spreading facilities).

AE-10 Expansion of North Canal Spreading Works = Through conversion of approximately 160 acres of permanently cropped agricultural lands to additional groundwater recharge facilities as part of the District's existing North Canal Spreading Works, approximately 500 AFY in demand reduction will occur due to the land use change (vineyards and almond orchards to spreading facilities).

AE-14 General In-Lieu Banking Program = The In-Lieu Banking Program consists of supplying surface water to landowners that previously relied only on groundwater. With future construction of a 40-acre regulating reservoir for the Sandrini in-lieu project, approximately 110 AFY of demand reduction (2.75 AF/acre) is estimated due to the land use change from previously irrigated lands.

AE-25 Education of Groundwater Use per Acre = Through this program groundwater users are provided an expected groundwater volume, as an education tool, prior to enforcement actions on groundwater allocations, with the goal of providing awareness of overdraft conditions, with an expected reduction in groundwater use/demand reduction. Given the education program is on-going and the quantification of program specific benefits cannot currently be assessed with certainty, AE-25 is not currently included in the “Glide Path”.

AE-26 Incentives for Land Conversion = Includes providing subsidies to incentivize groundwater users to convert land to alternative land uses (e.g. solar farms) and reduce groundwater extractions. Since 2015, there have been 485 acres of solar conversion, assuming a benefit of approximately 1,200 AFY of demand reduction (2.5 AF/acre). The District may consider a subsidy structure study to determine which subsidies would result in the greatest expected annual benefit in acre-feet per year. The District has

retained a consultant to undertake this study and is preliminarily estimating 10,000 AFY of demand reduction beginning in 2030 associated with this policy.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 34,770 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific Projects either **currently being implemented** or **have been implemented** that contribute to water supply augmentation include:

AE-2 On-Farm Recharge = AEWSD’s Landowner Recharge Program encourages individual growers to perform on-farm recharge for individual and aggregated benefits. Water may be recharged on-farm in private basins and/or distributed through irrigation systems across irrigated acreage in excess of current crop evapotranspiration (ET). From February to December 2023, over 13,000 AF was recharged through this program. Benefits from are estimated as approximately 13,250 AF augmented recharge every 2.5 years, or 5,300 AFY.

AE-4 – Forrest Frick Pipeline / KDWD Eastside Canal Intertie = Connection of the Forrest Frick Pipeline to the KDWD Eastside Canal to send AEWSD surface water supplies through KDWD and serve portions of the AEWSD Groundwater Service Area (GWSA) with temporary water contracts, utilizing existing infrastructure (turnouts, pipelines that are both District and landowner owned), representing an estimated 1,900 AFY of surface water to be used in-lieu of groundwater pumping.

AE-6 Private & Caltrans Basin Connections = Construction of pipelines to connect several on-farm private basins and Caltrans sumps near AEWSO, representing a supply augmentation of approximately 270 AFY through groundwater recharge.

AE-7 Sunset Spreading Works = Through construction at the 150 acre Sunset Spreading Works of exterior and interior dikes for a direct recharge facility, a new turnout and pump station from the KDWD Eastside Canal, and interbasin structures, up to an estimated 12,300 AFY of AEWSO's surface supplies will be recharged through this project in wet years, or 4,920 AFY on average taking non-wet years into account.

AE-8 DiGiorgio Unit In-Lieu Banking Program = The District will supply surface water when available through new facilities to the GWSA to meet its water requirements with the intent of reducing District-wide groundwater use. However, when surface water is in short supply and under agreement, the landowners could recover and return groundwater from their own wells to the District canal system through new pipelines once they have satisfied their own water needs. It is estimated that this project will result in 4,250 AFY in increased surface water deliveries to the GWSA.

AE-9 Frick Unit In-Lieu Project = The District will supply surface water when available through new facilities to the GWSA to meet crop irrigation requirements with the intent of reducing District wide groundwater use. It is estimated that this project will result in 3,500 AFY in surface water deliveries to the GWSA.

AE-10 Expansion of North Canal Spreading Works = Through conversion of approximately 160 acres of permanently cropped agricultural lands into additional groundwater recharge facilities as part of the District's existing North Canal Spreading Works, an average annual recharge benefit of 5,200 AFY (or 13,000 AF in an unconstrained year) will be attained.

AE-11 AEWSO South Canal Flood Study / Improvements = The South Canal Flood Study would review and possibly revise the Federal Emergency Management Agency (FEMA) floodplain in this area in order to increase the height of the canal bank to provide additional operational freeboard and accordingly reduce the potential for canal spills and subsequent flooding. Anticipated by 2030, the additional canal storage could allow for the capture and use of additional floodwater in-lieu of groundwater pumping (up to 100 to 200 AF).

AE-12 Conversion of Granite Quarry to Sycamore Ranch = The Granite Co. quarry, located upstream of the Sycamore Spreading Basins, is approaching the end of its operational life and could be converted into a balancing / detention / spreading reservoir. Excess flows in the North Canal could be pumped into the quarry reservoir, so the detained water could be recirculated for irrigation demands in-lieu of groundwater pumping and/or recharged. It is estimated that this project would provide 3,000 to 6,000

AFY of recharge within the Tejon-Castac Water District (TCWD) GSA; benefits are therefore not included in the Arvin GSA “Glide Path”.

AE-13 AEWSW Wasteway Basin Improvements = Through construction of a high-density-polyethylene (HDPE) liner along the levees, installation of recirculation pumps, and basin grading, the basin could serve as a location to divert and clarify sediment. It is estimated that approximately 1,550 AFY of stormwater capture would occur by 2040.

AE-14 General In-Lieu Banking Program = The In-Lieu Banking Program consists of supplying surface water to landowners that previously relied only on groundwater (GWSA). New infrastructure would have to be built to facilitate the implementation of this program. It is estimated that 2.75 AFY/ac will be provided to landowners dependent on groundwater.

AE-31 Exercising Existing Water Rights = The United States Bureau of Reclamation (USBR), San Luis Delta Mendota Water Authority (SLDMWA), Friant Water Authority (FWA), and San Joaquin River Exchange Contractors (SJREC) have entered into a memorandum of understanding (MOU) to collectively identify projects and potential actions aimed at improving drought resiliency south of the Delta, including AEWSW deliveries from the Friant-Kern Canal. The South of Delta Drought Resiliency Framework allows participating entities to voluntarily conserve and securely store a portion of their CVP south of Delta deliveries for subsequent use with the goal of providing at least a 5% allocation to CVP south of Delta agricultural water service/repayment contracts, reducing reliance on Delta exports in drought years. An additional 5% Class 1 reliability (2,000 AFY) increase is estimated as a result of the MOU, based on two timeframes: 2010 to 2019 and 2010 to 2022.

AE-32 Capture of Imported Water Return Flows from White Wolf Subbasin = Inflows from the White Wolf Subbasin can be attributed to return flows of imported surface water deliveries by AEWSW and Wheeler Ridge Maricopa Water Storage District (WRMWSW) to landowners within the White Wolf Subbasin. The average benefit of 9,000 AFY will be split equally between AEWSW and WRMWSW (4,500 AFY).

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

AE-1 ACSD Well #12 Construction = Constructed a new well to replace a well considered at risk of contamination due to its proximity to the Brown and Bryant Superfund Site. The new well (No. 12) was drilled concurrently with the AE-5 Arsenic Mitigation Project Phase II and allows Arvin Community Services District (ACSD) to bring a total of four new wells online since July 2016.

AE-3 Emergency 1,2,3-TCP Treatment Well #12 (EPA Replacement CW-1) =

Installation of emergency 1,2,3-TCP treatment at the well head, including installation of a skid mounted treatment system with two granular activated carbon media vessels for removal of 1,2,3-TCP, connection to the existing well discharge piping, installation of below ground and above ground influent and effluent piping and appurtenances, electrical and controls, and modifications to the existing well site PLC programming. Well #12 was completed and commissioned in May 2021.

AE-5 Arsenic Mitigation Project - Phase II = This project's objective is to bring the ACSD water system into compliance for Arsenic. All five of the ACSD active wells exceed the maximum contaminant level (MCL) of 10 ppb for Arsenic. The project was separated into two phases. Phase II involved drilling three new wells, constructing a 1.0-million-gallon (MG) storage tank and booster pumping plant, and connecting the facilities to the existing distribution system. The original five (5) water wells will then be abandoned and destroyed in accordance with Kern County Standards. Well #18 was completed in December 2023.

AE-24 Groundwater Extraction Quantification Method = Application of a new policy to specify an approved method to quantify the individual and aggregated groundwater extractions for the required SGMA annual reporting. Some methods to consider (or a combination of them) are the following: (1) Irrigated Acreage determined by aerial imagery; (2) Irrigated area hybrid determined by annual crop survey alongside aerial imagery; (3) Calibrated energy records; (4) Volumetric flow measurement; (5) Remote sensing of evapotranspiration; (6) Other.

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction

alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA's position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.

- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by Arvin GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in

Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Several P/MAs have been identified and listed "As Needed" on Table 3 and could further reduce the deficit if needed, as summarized below:

AE-16 Sycamore Creek Detention & Sedimentation Basin – The proposed basin would serve to intercept sediment from Sycamore creek flows to prevent constriction where sediment deposits downstream, reduce the peak outflow, and prevent the likelihood of a canal and spreading basing breach. Detained water could be recirculated for irrigation demands or recharged for a 250 AFY groundwater supply augmentation benefit.

AE-17 Stormwater Management and Flood Control Improvements – Potential construction of new sedimentation/detention basins, flood ditch erosion protection, Spillway Basin expansion, lengthening the South Canal's siphon under David Road or extension of the South Canal liner through designated floodplain reaches could result in a to be determined additional amount of supply.

AE-18 Caliente Creek Habitat Mitigation and Groundwater Recharge – Through restoration of agricultural lands to native vegetation for flood mitigation, additional benefits could be realized; however, the exact benefits of the habitat mitigation and recharge project are to be determined.

AE-19 AEWSD Intake Canal / KDWD Farmer's Canal Intertie – By improving existing and/or constructing new interties between AEWSD Intake Canal and KDWD's Farmer's Canal, water exchanges between the two districts and Kern County partners could be facilitated with an expected 4,000 AFY additional supply.

AE-20 AEWSD North Canal Balancing Reservoir Expansion & Discharge Pipelines – The proposed project will consist of the installation of a pipeline system that will convey flows from the four (4) wells within the AEWSD Balancing Reservoir directly to the basin discharge structure and no longer through the basin low flow channels. Infiltration and evaporation losses on well discharge flows will be eliminated and power efficiency for the wells (kwh/af) will be significantly enhanced since all water pumped will be discharged into the North Canal, resulting in an additional 100 AFY of new supply, and 40 AFY in demand reduction.

AE-21 AEWSD Lateral Capacity Improvement Projects – By increasing delivery capacity of the AEWSD N-55 lateral system through replacement of lateral system and

landowner pipelines, renovation of storage tanks, construction of pump stations, etc., an additional 1,000 AFY could be available to AEWSD.

AE-22 AEWSD South Canal Balancing Reservoir – Through creation of a reservoir to allow water storage for flow mismatches in the AEWSD canal system during operation or emergencies, this reservoir would increase storage capacity by ~500 AF, depending on location and result in a 190 AFY reduction in demand.

AE-23 Reclamation of Oilfield Produced Water – Reclaimed water from oil production facilities could be utilized to serve irrigation demands in-lieu of groundwater pumping, for an additional 1,000 AFY of supply.

AE-24 Wastewater Reclamation with City of Arvin & Bakersfield – By utilizing treated wastewater from Cities of Arvin and Bakersfield wastewater treatment facilities for irrigation purposes, an approximate 10,000 AFY of additional supply could be available.

AE-27 On-farm Water Conservation – Through the Natural Resources Conservation Service's landowner incentive programs to assist in implementing various conservation activities, including but not limited to: irrigation system improvements, water/ nutrient/ pest management, and pump engine replacement, ~250 AFY of demand reduction could be realized.

AE-28 Groundwater Fee Increase – AEWSD could increase GWSA cost to incentivize groundwater users to reduce groundwater extractions and take surface water when available. The District may consider modifying its fee structure study to determine the best strategy for curbing groundwater overdraft without causing inequitable economic impact. Exact benefits of the groundwater fee increase are to be determined.

AE-29 Groundwater Allocation per Acre – AEWSD could provide a finite groundwater allocation on a per acre basis. The exact demand reduction for this P/MA is to be determined based on the study and policy enacted.

AE-30 Groundwater Marketing & Trading - AEWSD could pursue a groundwater market and trading program to provide uses and beneficial users more flexibility in utilizing a groundwater allocation. The groundwater trading structure could include: (1) Bilateral contracts or "coffee shop" markets; (2) Brokerage; (3) Bulletin boards; (4) Auctions and reverse auctions; (5) Electronic clearing-houses or "smart markets" ; (6) Other trade structures. Exact benefits of the groundwater market and trading program are unknown at this time.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the Arvin GSA has a minimum target P/MA goal of approximately 34,770 AFY. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in *Circumstances for Implementation*, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows and corresponding response in water levels. For P/MAs that involve indirect supply augmentation through, for example, increased surface water storage capacity and delivery flexibility, quantification of the benefit will require tracking a comparison of the observed water supply condition (e.g. total imported water) against a hypothetical condition where the P/MA was not in place. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (AE-1, AE-2, AE-6, AE-7, AE-8, AE-10, AE-11, AE-12) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. AEWSD has a contract with the USBR for 40,000 AFY of Class 1 water and 311,675 AFY of Class 2 water from the Friant Division of the CVP delivered through the Friant-Kern Canal (FKC). AEWSD also has access to water from the following associated sources: Recovered Water Account (RWA), Unreleased Restoration Flows (URF), Recapture & Recirculation (R/R), and Section 215 water.

The volume of CVP supplies is anticipated to decrease under the 2030 Climate Change Scenario relative to the Baseline Scenario, and that decrease is the main cause of the projected deficit. However, the Friant Water Authority (FWA) projections of Friant-Kern deliveries to AEWSD (FWA, 2018) assume a certain level of demand for Paragraph 16(b) wet year supplies, as described in the following excerpts:

“This analysis simulates 16(b) delivery via the Friant Kern and Madera canals with an anticipated level of future groundwater infiltration facilities throughout the Friant Division. These facilities were contemplated as a result of SJRRS implementation, and are described by analysis in the SJRRS PEIS/R.

The future management of 16(b) supplies cannot be fully anticipated at this time. Policy for the allocation of supplies has been in a constant state of evolution. For the purposes of this TM, a suggested allocation of 16(b) supplies among Friant Contractors is presented, based on the relative expected reduction in delivery of SJRRS on Class 1 and 2 contract supplies, by contractor.”

The FWA (2018) further states:

“The second SJRRS water category, Paragraph 16(b) supplies, are quantified in the CalSim II model by assuming a demand for this potential supply and meeting this demand, limited by availability of flood water and channel capacity for delivery.”

The level of demand within the Arvin GSA that is assumed in the CalSim II modeling for the FWA analysis is almost certainly less than the level of demand under the proposed P/MAs discussed herein. Therefore, with additional demand for wet year (Paragraph

16(b)) supplies created by implementation of various P/MAs within the Arvin GSA, this analysis assumes that additional Paragraph 16(b) water will be available.

In addition to the apparent underestimation of Friant Kern supplies available to AEWSD described above, the Arvin GSA will continue its efforts to refine modeling results but also continue to secure additional water supplies for importation into the Arvin-Edison Management Area through transfers, exchanges, and purchases, as necessary and possible given pricing and timing constraints.

Pursuant to transfer agreements with partner agencies, AEWSD has also obtained imported water from other sources such as the State Water Project (SWP), Westside CVP, and the Kern, Kings, Kaweah, and St. John's Rivers

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor's place of service for future use. AEWSD has received SWP water through water transfer agreements with various State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use. AEWSD could purchase excess Article 21 water through transfers or exchanges with a State Water Contractor for delivery to existing project recharge facilities when such water is available.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

AEWSD currently receives Kern River water when it is available for water recharge through water service agreements with the City of Bakersfield and other water right holders. Kern River "release" or "flood" water is also available to AEWSD when water (1) is offered to all takers willing to sign a Notice/Order; or (2) is offered to the Kern

River/California Aqueduct Intertie for disposal; or (3) is expected to flood farm acreage; or (4) is expected to be delivered into the Kern River Flood Channel for disposal out-of-county. AEWS D also takes this released water from the Kern River for water recharge if and when available.

3rd Party Programs

AEWS D participates in RRBWSD’s 3rd party banking program along with several Kern County and outside of Kern County agencies. Most of these programs are structured on a 2:1 basis, meaning for every acre-foot stored for the 3rd party for later drought supply, RRBWSD receives one for its banking services. These supplies come from the above three identified sources and have provided drought protection.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Water banking recharge projects have been designed assuming a wet year occurs every 2.5 years, with a maximum benefit over 100 days. Water supply augmentation benefits have been calculated as follows:

*Annual Water Benefit = estimated infiltration rate ft/day * wetted acres * 100 days operation per year * 40 percent of years being wet.*

P/MAs (AE-1, AE-2, AE-6, AE-7, AE-8, AE-10, AE-11, AE-12) will be met with CVP project water as discussed above or pursuant to transfer agreements with partner agencies for imported water from the SWP, Westside CVP, and the Kern, Kings, Kaweah, and St. John’s Rivers.

Legal Authority Required

23 CCR § 354.44(b)(7)

The AEWS D is a water storage district, that possesses the legal authority to implement P/MAs discussed herein. Arvin GSA is also a GSAs, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to

initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- AEWSF funds, generally supported by fees charged to landowners within AEWSF, including potentially the following:
 - General fund
 - SGMA compliance subaccount (to be created)
- Partnering agencies for certain P/MAs (e.g., KDWD, TCWD, Cities of Bakersfield and Arvin, oil field producers)
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and the FEMA
- ACSF funds, generally supported by local rate payers
- Other.

Estimated costs for Arvin GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Arvin GSA	Estimated Costs	
	One-time	Annual
Implemented	\$19,550,000	\$60,000
Functional	\$0	\$0
In-Process	\$74,600,000	\$142,000
As-Needed	\$28,310,000	\$55,000
Total	\$122,460,000	\$257,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside

sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand and groundwater pumping by land retirement (AE-26). The formation of an as-needed groundwater budget program (AE-29, AE-30) would likely include mechanisms to allow for trading or exchange of pumping allocations within designated areas, subject to constraints dictated by groundwater conditions observed within the Monitoring Network and policies developed by the respective Board of Directors. Through this combination of increased recharge during wet years and demand reduction, the Arvin GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Buena Vista GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for BVWSD GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (0 AFY) of the projected deficit of 0 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example BV-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits						Source(s) of Water	Legal Authority Required	Estimated Costs

<i>Projects</i>		Implemented	Functional	In-Process	As-Needed							Implemented	Functional	In-Process	As-Needed								
BV-1	Magnetic Flow Meter Installation	Magnetic flow meters have been installed on all production wells in BV. In addition to the approximately 200 wells now having magnetic flow meters, meters are being installed on all new and replacement wells constructed in the District.	✓		✓		Complete	NA	NA	Implemented and Operational	Ongoing	2016-	0	0		✓	✓	NA	None	\$800,000	\$1,600	BVWSD (water charges)	
BV-2	Palms Recharge Project	The BVWSD/GSA has the 1,142-acre Palms Recharge Project. This facility is located at the southern tip of the District's Buttonwillow Service Area and was constructed on lands acquired by the District and retired from agricultural production.	✓	✓	✓	Land Retirement Supplemental Water Recharge	Complete	NA	NA	Implemented and operational	2019	2020-	8,700	3,340	✓	✓	✓	NA	Kern River and SWP water and occasionally Friant water	None	\$26,000,000	\$52,000	BVWSD (water charges)
BV-3	Corn Camp Recharge Project	In 2020 the BVWSD/GSA completed the 85-acre Corn Camp Recharge Project. This facility is located within the District and was constructed on land acquired by the District under a 20-year lease with eight 5-year options to extend the lease for a total of 60 years. The land has been retired from agricultural production.	✓	✓	✓	Land Retirement Supplemental Water Recharge	Complete	NA	NA	Implemented and operational	2021	2020-	470	250	✓	✓	✓	NA	Kern River and SWP water and occasionally Friant water	None	\$1,750,000	\$3,500	BVWSD (water charges)
BV-4	Annexation Demand Reduction Project	The District has purchased 900 acres of white lands and taken it out of production. This land is adjacent to the District and is in the process of being annexed.	✓	✓	✓	Land Retirement	Complete	NA	NA	Implemented and operational	2021	2020-	0	2,630	✓	✓	✓	NA	NA	None	\$9,000,000	\$18,000	BVWSD (assessment)
BV-5	Daley Ranch Recharge Project	The BVWSD/GSA purchased 91 acres that the District has used to develop the Daley Ranch Recharge Project. This facility is located within the District, and the property has been retired from agricultural production.	✓	✓	✓	Land Retirement Supplemental Water Recharge	Complete	NA	NA	Implemented and operational	2022	2021-	350	270	✓	✓	✓	NA	Kern River and SWP water and occasionally Friant water	None	\$4,800,000	\$9,600	BVWSD (water charges)
BV-6	Completed Pipelines	Completion of 83 miles of pipeline (36" to 54") to improve distribution of irrigation water by providing an alternative to unlined canals and installing new connections to the California Aqueduct. The pipelines give the District more discretion as to when recharge is performed. The pipeline system has been designed to operate on gravity flow in non-peak irrigation months. All construction has been performed since 2014. Projects include Northern Area, Northern Area - Southern Extension, Northern Area - Eastern Extension, and 7th Standard pipelines.	✓	✓	✓		Complete	NA	NA	Implemented and Operational	2022	2015-	0	0		✓		NA	Kern River and SWP water and occasionally Friant water	None	\$72,000,000	\$144,000	BVWSD (Capital Improvement Fund), Federal and State grants
BV-7	Completed Pump Stations	Three pump stations (two 1,200-hp and one 600-hp) have been completed to augment flow in the District's distribution system during peak months.	✓				Complete	NA	NA	Implemented and Operational	2023	2020-	0	0		✓		NA	Kern River and SWP water and occasionally Friant water	None	\$6,000,000	\$12,000	BVWSD (Capital Improvement Fund), Federal and State grants
BV-8	Future Pump Station	Design and environmental documentation of the 600-hp Brite Rd Pump Station is in progress.	✓				Completion of Project	NA		Design/Environmental Compliance	2026	2025-	0	0		✓		NA	Kern River and SWP water and occasionally Friant water	as required by CEQA	\$2,450,000	\$4,900	BVWSD (Capital Improvement Fund), Federal and State grants
BV-9	BV Future Pipelines	Construction of an additional 20 miles of pipeline to improve distribution of irrigation water by replacing open ditch laterals. Projects include the Belridge, Corn Camp Loop, Wasco Way, Elk Grove, and Brite Road pipelines. Important for delivering surface water to reduce reliance on marginal quality groundwater.	✓	✓	✓		Completion of Project	NA		Design/Environmental Compliance	2027	2026-	0	0		✓		NA	Kern River and SWP water and occasionally Friant water	as required by CEQA	\$10,000,000	\$20,000	BVWSD (Capital Improvement Fund), Federal and State grants
BV-10	McAlister Ranch Recharge Project	The BVGSA/BVWSD continues to work through regulatory hurdles in the development of a 2,072-acre water bank. BVWSD owns 86% the project and the remaining 14% is on the market. The DEIR is close to completion.	✓	✓	✓	Land Retirement Supplemental Water Recharge	Completion of Project	Completion of Project	In CEQA process	Design/Environmental Compliance	2028	2028-	18,000	5,600	✓	✓	✓	NA	Kern River	as required by CEQA	\$35,000,000	\$100,000	BVWSD (assessment)

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented** or **in-process** that contribute to water demand reduction include:

BV-2 Palms Recharge Project = This facility is located at the southern tip of the District's Buttonwillow Service Area and was constructed on lands acquired by the District and retired from agricultural production. The project was constructed by removing clay overburden to create in-District recharge ponds in phases performed in 2016, 2017, 2018 and 2019. The project has now followed 1,142 acres of irrigated land, representing a demand reduction benefit of approximately 3,340 AFY (Net irrigated x ETiw average for 5 years).

BV-3 Corn Camp Recharge Project = In 2020 the BVWSD GSA completed the 85-acre Corn Camp Recharge Project. This facility is located within the District and was constructed on land acquired by the District under a 20-year lease with eight 5-year options to extend the lease for a total of 60 years. The project removed irrigated land from production for conversion to recharge facilities. Followed 85 acres representing a demand reduction benefit of approximately 250 AFY (Net irrigated x ETiw average for 5 years).

BV-4 Annexation Demand Reduction Project = The District has purchased 900 acres of irrigated white lands and taken it out of production. This land is adjacent to the District and is in the process of being annexed. This following of annexed land represents a demand reduction benefit of approximately 2,630 AFY (Net irrigated x ETiw average for 5 years).

BV-5 Daley Ranch Recharge Project = The BVWSD GSA purchased 91 acres of irrigated land to develop the Daley Ranch Recharge Project. This facility is located within the District, and the property has been retired from agricultural production of conversion to recharge facilities. The following of 91 acres represents a demand reduction benefit of approximately 270 AFY (Net irrigated x ETiw average for 5 years).

BV-10 McAlister Ranch Recharge Project = The BVWSD GSA continues to work through regulatory hurdles in the development of a 2,072-acre water bank. The DEIR is close to completion. BVWSD owns 86% the project and the remaining 14% is on the market. The proposed project will remove 2070 acres (gross) from production. 160 acres of this has not been farmed due to Native American cultural use. Following of land

to construct recharge facilities represents a demand reduction benefit of approximately 5,580 AFY (Net irrigated x ETiw average for 5 years).

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 0 AFY by the January 2040 GSP implementation deadline.

GSA-specific Projects either **currently being implemented** or **have been implemented** that contribute to water supply augmentation include:

BV-2 Palms Recharge Project = This facility is located at the southern tip of the District's Buttonwillow Service Area and was constructed on lands acquired by the District and retired from agricultural production. The project was constructed by removing clay overburden to create in-District recharge ponds in phases performed in 2016, 2017, 2018 and 2019. The Palms Recharge Project has been operated once since 2020 recharging 57,928 AF in 2023. Average annual recharge projected to be 8,700 AFY (0.15 x 2023 recharge volume).

BV-3 Corn Camp Project = In 2020 the BVWSD GSA completed the 85-acre Corn Camp Recharge Project. This facility is located within the District and was constructed on land acquired by the District under a 20-year lease with eight 5-year options to extend the lease for a total of 60 years. The project removed irrigated land from production for conversion to recharge facilities. The project has been operated once since 2020 recharging 3,144 AF in 2023. Projected average annual recharge is 470 AFY (0.15 x 2023 recharge volume).

BV-5 Daley Ranch Project = The BVWSD GSA purchased 91 acres of irrigated land to develop the Daley Ranch Recharge Project. This facility is located within the District, and the property has been retired from agricultural production of conversion to recharge facilities. The project has been operated once since 2020 recharging 2,344 AF in 2023. Projected average annual recharge is 350 AFY (0.15 x 2023 recharge volume).

BV-10 McAllister Ranch Project = The BVWSD GSA continues to work through regulatory hurdles in the development of a 2,072-acre water bank. The DEIR is close to completion. BVWSD owns 86% of the project and the remaining 14% is on the market. When fully operational the project is expected to augment supply by 18,000 AFY.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-3 Exceedance Policy – Subbasin wide policy to provide protocols for groundwater GSAs to investigate exceedances. This policy is developed in conjunction with the Subbasin Well Mitigation Program which identifies mitigation strategies for vulnerable communities.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community

well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by BVWSD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new

ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts. No projects and management actions have been identified and listed under the category of "As Needed", however the BVGSA's implementation of KSB 3 and KSB 5 can be adaptively managed to respond to exceedances of Minimum Thresholds, if needed.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary "Glide Path" has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the "Glide Path" Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the BVWSD GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.

- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in *Circumstances for Implementation*, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., reduction of irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place and water consumption of the land uses present in the absence of the P/MA was estimated. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (BV-2, BV-3, BV-5, BV-10) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be delivered from the Friant-Kern Canal through the CVC. The Friant-Kern Canal capacity has been recently hampered by subsidence which has limited available supplies. Remediation efforts are underway and should restore access to these critical supplies by 2030.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor’s place of service for future use. BVWSD currently receives SWP water through a water supply contract (Table 1 Entitlement 21,300 AF) with Kern County Water Agency (KCWA), one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use. BVWSD purchases excess Article 21 water through its State Water Contractor for delivery to existing project recharge facilities using the CVC when such water is available.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These

water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

BVWSD currently receives Kern River water under its pre-1914 water rights which it has administered since the formation of the District. At the time of formation, as the successor to the Second Point interests under the Miller-Haggin Agreement, BVWSD became entitled to provide for the distribution of the Second Point water rights that were tied to the Company's lands

3rd Party Programs

BVWSD partners with RRBWSD for a third-party banking project with Castaic, now known as Santa Clarita Valley Water Agency (SCVWA). For each year BVWSD banks 9,706 AF in RRBWSD, often in large amounts in very wet years. In turn, RRBWSD supplies 8,250 AF annually to SCVWA and benefits from a 15 percent leave behind. BVWSD also supplies 2,750 AF of surface water to SCVWA annually. This contract runs through December 31, 2036. BVWSD is required to supply 12,9706 AF for the years 2025-2036, or 116,472 AF. BVWSD has supplied all but 12,000 AF of the water required through 2036. This equates to an annual requirement for fulfillment of 1,000 AF/year in addition to the 2,750 AF of surface water supplied annually. This additional requirement of water, 3,750 AF annually through 2036, is significantly less than BVWSD's annual surplus.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Water recharge projects have been designed with a conservative water supply augmentation benefit calculation. Water supply augmentation benefits have been calculated as follows:

Annual Water Benefit for Existing Facilities = wet year recharge measured in 2023 x 0.15 to adjust for the expected frequency of wet year flows.

This conservative planning method estimates that the total recharge facility opportunity time would be 8 percent of the time. This is less than half of the long-term (2001-2020) estimate of recharge opportunities occurring in 20 percent of years.

Legal Authority Required

23 CCR § 354.44(b)(7)

The BVWSD is a water storage district, that possesses the legal authority to implement P/MAs discussed herein. BVWSD GSA is also a GSAs, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

☑ 23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time. As of this writing, the BVWSD has accrued no indebtedness for implementation of P/MAs.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges.
- Grant funding from sources including DWR, and United States Bureau of Reclamation (USBR).

Estimated costs for BVWSD GSA P/MAs by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Buena Vista Water Storage District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$120,350,000	\$290,700
Functional		
In-Process	\$47,475,000	\$229,900
As-Needed		
Total	\$167,825,000	\$520,600

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As stated previously in **Section 9 Water Budget Information**, under historical conditions (WY 2010 – 2019) the BVWSD GSA is in a state of water supply/demand surplus based on the “checkbook” water budget planning tool and on water budgets developed by the District and presented in previously submitted GSPs. Under the projected Baseline and 2030 (and 2070) Climate Change Scenarios, the net water supply surplus is projected to continue within the GSA. One primary means by which the current surplus will be maintained is through implementing P/MAs that augment supplies from additional outside sources of water, particularly during normal to wet years. Therefore, the representations of the glide path for the BVWSD GSA represent the schedule for P/MA implementation and accrual of water supply demand reduction benefits, but do not imply that these P/MAs are needed to correct an overdraft. Many of the projects discussed herein are designed to improve retention and management of wet-year supplies available during periods of high flows in the Kern River and high deliveries from the SWP and CVP. These P/MAs include various direct recharge projects and projects that increase storage capacity and recovery and distribution flexibility.

In addition to these supply augmentation projects, the portfolio also includes policy-based management actions aimed at possible minor demand reduction. These management actions aim to reduce water demand through land retirement. Through this combination of increased recharge and demand reduction, the GSA’s P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods to enable the BVWSD GSA to maintain its historic condition of having water supplies surplus to demands.

Cawelo Water District GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage "deficit" of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning documents, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSAs. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

(b) Implementation Glide Path – Cawelo Water District GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for Cawelo Water District GSA (CWD GSA) in Table 2 below and illustrated on Figure 3. The “Glide Path” is aimed to address 25 percent of the projected deficit of during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to have exceeded the target deficit reduction as early as 2020. Please note that the last row of Table 2 shows an increasing volume of surplus water resulting from CWD GSA P/MA implementation. As CWD GSA does not have a historical deficit, P/MA demand reduction and supply augmentation will provide resilience in the event of drier conditions or other unforeseen changes to the GSA’s water balance.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example RRB-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA PMA's)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits							Source(s) of Water	Legal Authority Required	Estimated Costs		
			Groundwater Levels & Storage	Groundwater Quality	Land Subsidence								Primary (AFY)		Secondary							One-time Costs	Ongoing Costs (per year)	Potential Funding Source(s)

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs that **have either been implemented** or **are currently being implemented** or **in-process** and contribute to water demand reduction include:

CWD-3 Increase Recharge Capacity = Implement programs and/or projects to increase water recharge capacity to capture and recharge additional wet year high flow waters to store for future use. CWD GSA will also consider implementing a program to incentivize landowners to use their land for recharge.

CWD-9 Voluntary Land Conversion = Develop a program to incentivize landowners to reduce their total crop demand by converting farmed land to groundwater recharge areas.

CWD-11 Crop Conversion and Irrigation Efficiency = Incentive programs for growers to convert to crops that require less water and to improve irrigation practices.

CWD-12 Agriculture to Urban Land Use Conversion = Conversion of agricultural land use to urban/commercial land use due to urban expansion.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA's

Water Supply Augmentation P/MAs are the secondary means of Implementation of a "Glide Path" that will result in closing the current identified "deficit" of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs that **have either been implemented** or are **currently being implemented** or **in-process** and contribute to water supply augmentation include:

CWD-1 New Water Supply Purchases = Implement programs that will acquire long-term new water contracts and/or establish a water purchase fund. The main goal would be to secure long-term water contracts and/or build a reserve fund for water purchases when supplemental water is available.

CWD-2 Friant Pipeline Project = Construct a pipeline, pump station, and turn-in/out structure to connect the CWD Famoso Recharge Basins directly to the Friant-Kern Canal. This project will allow for greater access to supplemental water and support additional banking programs.

CWD-3 Increase Recharge Capacity = Implement programs and/or projects to increase water recharge capacity to capture and recharge additional wet year high flow waters to store for future use. CGSA will also consider to implement a program to incentivize landowners to use their land for recharge.

CWD-4 New Cawelo GSA Banking Partners = Modify existing CWD banking programs to increase the amount of water banked or initiate new banking programs and partners as a secondary priority.

CWD-5 Poso Creek Flood Water Capture = Construct additional facilities to utilize existing appropriative rights to divert supplementary water from high flows from Poso Creek.

CWD-6 Water Treatment Facilities = Construct additional potential water treatment facilities/operations to acquire additional treated oilfield recycled produced water (RPW) that is safe for crop irrigation. When irrigation demands are low the water will be recharged for later use.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation - The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-

Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS),

as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation - The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-6 White Land Demand Management – The Subbasin, as part of the 2024 GSP amendment process, developed a more accurate well inventory based on available

databases and field verifications. This management action will continue to provide improvements and maintenance of the Subbasin's existing well inventory and house the well registry within the Kern County Subbasin data management system. At least annually, the Subbasin will update the system using DWR/County well permit information and well surveys. Additional details regarding the data sources and methodologies used to develop the improved well inventory can be found in Section 14.

KSB-7 Well Registry – The Subbasin, as part of the 2024 GSP amendment process, developed a more accurate well inventory based on available databases and field verifications. This management action will continue to provide improvements and maintenance of the Subbasin's existing well inventory and house the well registry within the Kern County Subbasin data management system. At least annually, the Subbasin will update the system using DWR/County well permit information and well surveys. Additional details regarding the data sources and methodologies used to develop the improved well inventory can be found in Section 14.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by CWD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary "Glide Path" has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070).

P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the Cawelo Water District GSA does not have a minimum target P/MA goal. The P/MAs presented herein are

expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 1. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit will be quantified directly through flow measurement. For P/MAs that involve indirect supply augmentation through increased groundwater storage or banking, quantification of the benefit will require tracking of project water deliveries and estimates of indirect supply increases based on specific project conditions. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against the recent historical and projected condition without the P/MA in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (CWD-1, CWD-2, CWD-3, CWD-4, CWD-5, CWD-6, and KSB-1) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be delivered from the Friant-Kern Canal through various Cawelo owned or jointly owned facilities. Cawelo can obtain CVP Section 215 flood water supplies through an annual contract with USBR, when available. The Friant-Kern Canal capacity has been recently hampered by subsidence which has limited available supplies. Remediation efforts are underway and should restore access to these critical supplies by 2030.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor's place of service for future use. Cawelo currently receives SWP water through a water supply contract (Table 1 Entitlement 38,200 AF) with Kern County Water Agency (KCWA), one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use. Cawelo purchases excess Article 21 water through the KCWA for delivery to existing project recharge facilities using the CVC when such water is available.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River and Poso Creek water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion. In 2000, Cawelo was issued a permit to divert water from Poso Creek for beneficial use at a rate of approximately 110 cfs with the volume limited to 30TAF between November 1 and June 14. An agreement between Cawelo, North Kern Water Storage District, and

Semitropic Water Storage District allocated the first 135 cfs of Poso Creek flow to Cawelo.

Cawelo currently receives Kern River water when it is available for irrigation demands and groundwater recharge through water service agreements with the City of Bakersfield, the Kern County Water Agency, and other water right holders. Kern River “release” or “flood” water is also available to Cawelo when water (1) is offered to all takers willing to sign a Notice/Order; or (2) is offered to the Kern River/California Aqueduct Intertie for disposal; or (3) is expected to flood farm acreage; or (4) is expected to be delivered into the Kern River Flood Channel for disposal out-of-county. Cawelo also takes this released water from the Kern River for groundwater recharge if and when available.

3rd Party Programs

Cawelo has long operated as 3rd party banking program for an outside of Kern County agency. Over the past several years more interest has been expressed in participating in Cawelo banking programs for drought protection needs. Cawelo's banking programs operate at 2:1 (i.e., for every 2 AF of water delivered to Cawelo, the banking partner receives credit for 1 AF). The excess 1 AF of water is credited to Cawelo for future recovery and use. These supplies come from the above three identified sources and have provided groundwater supply for Cawelo and drought protection for the 3rd party.

Treated Oilfield Recycled Produced Water

Cawelo has active partnerships with oil producers who produce water as part of the oil extraction process. This water is treated for non-potable uses including agricultural and other irrigation uses.

Legal Authority Required

23 CCR § 354.44(b)(7)

The CWD is a water district, that possesses the legal authority to implement P/MAs discussed herein. CWD GSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility

studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- CWD assessments and/or water charges.
- CWD landowner financial sponsorship.
- Financial sponsorship from third party banking partners.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for CWD GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Cawelo Water District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$8,750,000	\$8,050,000
Functional	\$0	\$0
In-Process	\$33,175,000	\$205,000
As-Needed	\$60,000,000	\$500,000
Total	\$101,925,000	\$8,755,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which future potential deficits and total Subbasin deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs

include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. Through this combination of increased recharge during wet years and demand reduction, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Eastside Water Management Area Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as

summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address 25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 1. (Glide Path – P/MA Planned Deficit Reduction vs. Milestones)

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Eastside Water Management Area

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for EWMA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (985 AFY) of the projected deficit of 3,940 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2028.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example EWMA-1) if the P/MA is specific to the individual GSA. P/MAs are numbered with “KSB-#” if the P/MA is considered to be Subbasin wide in nature. Note that “KSB” P/MAs have either full Subbasin participation or nearly all GSAs participating. All projects and management actions are described in detail on the tables below.

KSB-3	Exceedance Policy	Subbasin wide policy to provide protocols for groundwater GSAs to investigate exceedances. This policy is developed in conjunction with the Subbasin Well Mitigation Program which identifies mitigation strategies for vulnerable communities.	✓	✓	✓		When an MT exceedance occurs for any sustainability indicator. Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the estimated “deficit” of 3,940 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented** or **in-process** that contribute to water demand reduction include:

EWMA-7 Agricultural Demand Reduction – Reduction of irrigated acreage, or modification of irrigation techniques or crop types to reduce water usage. Currently, the basin model estimates the native yield as 0.15 acre-feet per acre, and KSB-4 (Coordination with Basin Study) will improve the estimate of native yield. Once the basin study is completed, the EWMA will review the updated water budget and implement this management action.

EWMA-9 Transferrable Water Credit Program – Establish a system of transferrable water credits. This project will require coordination with KSB-4 (Coordination with the Basin Study), and evaluation of any legal requirement to implement. Once the basin study is completed, a system of transferrable water credits will be refined using a technical and legal approach prior to implementation in 2025.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in Appendix D. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MAs

Water Supply Augmentation P/MAs are the secondary means of Implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 3,940 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific Projects either **currently being implemented** **or have been implemented** or **in-process** that contribute to water supply augmentation include:

EWMA-1, Produced Water Supply Project – Development of oilfield produced water supplies to potentially reduce groundwater demand. The EWMA has begun identifying produced water projects and several EWMA irrigators have already initiated produced water projects resulting in a water supply augmentation of over 1,000 AFY.

EWMA-2 Surface Runoff Capture – Develop surface runoff capture and enhanced infiltration in impoundments. This potential project will require further legal and engineering feasibility studies to determine the viability and potential yields of a project. KSB-4 (Coordination with the Basin Study) will assist in the initial technical feasibility of this project.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in Appendix T. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction

alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA's position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see Appendix U). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.

- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in Appendix V.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by EWMA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in

Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Circumstances for Implementation

☑ 23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented. In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional. In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process. Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As Needed. As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MAs, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

☑ 23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the EWMA has a net water budget deficit over the historical period based on the specific budget model. The projected water budget indicates that under the 2030 Climate Change Scenario, the EWMA's net deficit is approximately 3,940 AFY. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).

- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

P/MAs are expected to provide benefits related to water quantity. Water supply augmentation P/MAs benefits can be measured by the flow of those projects (i.e. from flow meters on ponds, etc.). For P/MAs with indirect supply augmentation, benefits can be evaluated by comparing against a baseline scenario to measure those benefits.

Understanding and quantifying P/MA benefits will assist in understanding if progress is being made toward achieving the basin sustainability goal.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Produced Water

Produced water is available on a continual, 365-day basis due to the operation of oil production and is therefore a very reliable and consistent source of water.

Legal Authority Required

☑ 23 CCR § 354.44(b)(7)

EWMA is a non-profit entity and an associate member of the Kern Non-Districted Lands Authority GSA which possesses the legal authority to implement P/MAs discussed herein. Furthermore, the EWMA is working on forming a water district and ultimately a GSA which will retain its own authority to implement P/MAs in its boundaries.

Estimated Costs and Plans to Meet Them

☑ 23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for EWMA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

East Water Management Area	Estimated Costs	
	One-time	Annual
Implemented	\$35,000	\$50,000
Functional	\$2,950,000	\$50,000
In-Process	\$1,855,000	\$227,000
As-Needed		
Total	\$4,840,000	\$327,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

The EWMA does not employ any artificial groundwater recharge projects.

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Table 1. (Glide Path – Target Deficit Reduction)

Kern County Subbasin Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		Project and Management Action Implementation Schedule (AFY)

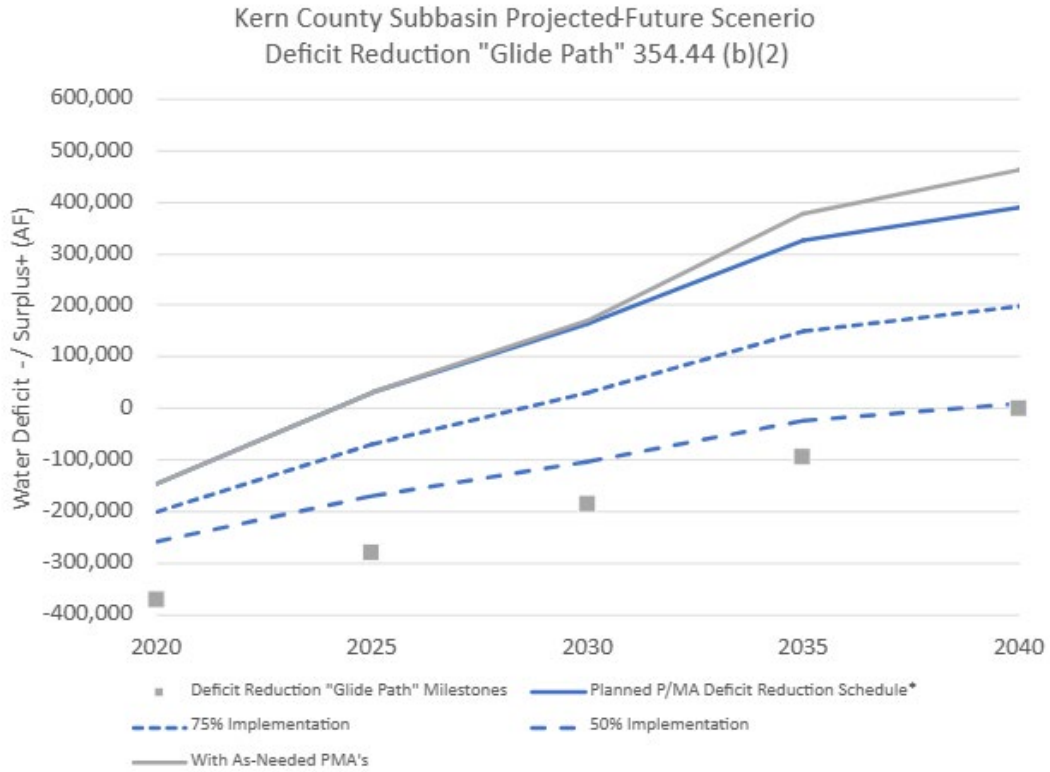

Figure 1. (Glide Path – P/MA Planned Deficit Reduction vs. Milestones)

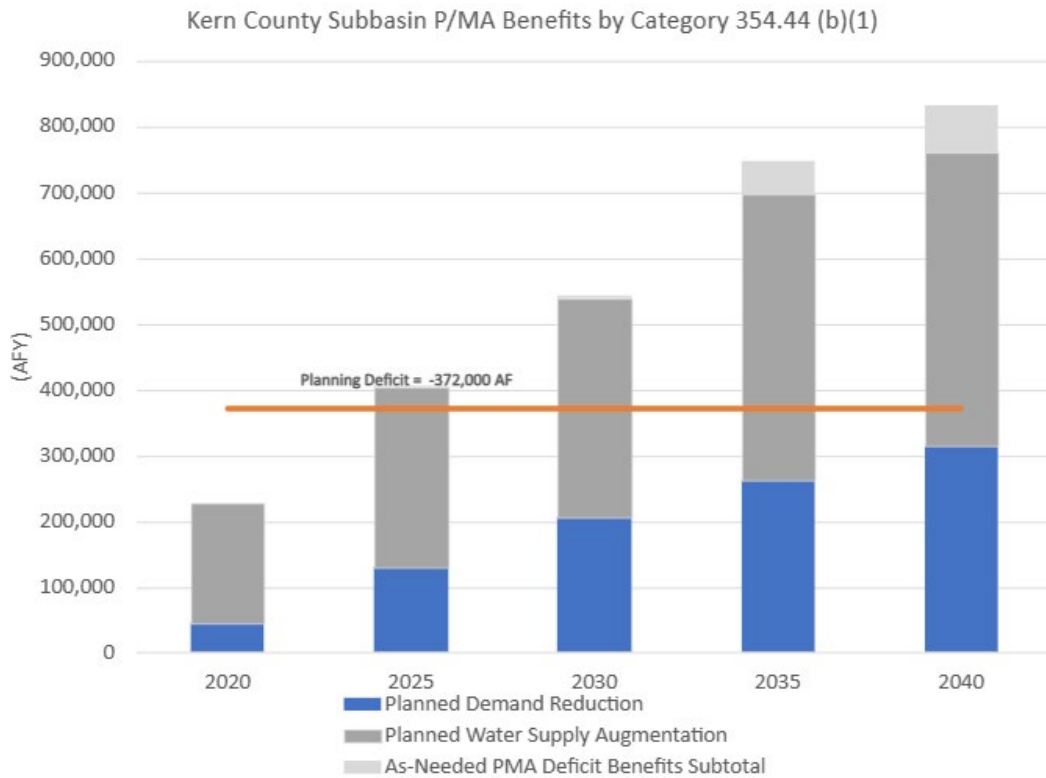

Figure 2.(P/MA by Category)

(b) Implementation Glide Path – Henry Miller Water District GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for HMWD GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (333 AFY) of the projected deficit of 1,330 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example HMWD-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 1,330 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented** that contribute to water demand reduction include:

HMWD-1 Demand Reduction due to Land Fallowing – This P/MA includes the ability to fallow up to 66% of developed district lands to maintain sustainability over time, representing a demand reduction benefit of approximately 3,600 AFY compared to the P/MA checkbook timeframe of 2010-2019. The demand reduction was quantified by comparing the average annual crop demand from the 2010-2019 period to the expected average annual crop demand with up to 66% of developed lands being fallowed with P/MA HMWD-1.

The landowners within the District have been fallowing lands in times of drought since before the formation of the District in the 1960’s. Thus, the GSA in coordination with its landowners can implement this P/MA in any year type and realize the benefits immediately especially in response to drought, or continued drought conditions. During wet years when available surface water supplies to the District are plentiful, the GSA can reduce the required demand reduction while still maintaining sustainability within the GSA.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of Implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 1,330 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific Projects either **currently being implemented** or **have been implemented** that contribute to water demand reduction include:

HMWD-3 Recovery of Banked Supplies from the Pioneer Project – This P/MA involves the recovery of banked water from the Pioneer Banking Project to reduce groundwater use within the District, resulting in supply augmentation of approximately 250 AFY. The P/MA yield was determined using the following calculations and assumptions, rounded to the nearest 50 acre-feet:

- *Kern R. April-July Runoff POA When Recovery for HMWD is Possible: 55-90%*
- *Frequency of Kern River Year Type from 1995-2023: 6/29 or 21%*
- *Typical Pioneer Recovery Capacity: 85 cfs-days or 5,128 acre-ft/month*

- *Typical Simultaneous Participating Member Units or Districts: 8 Units*
- *Recovery Capacity per Unit: 5,128 acre-ft/month / 8 Units = 641 acre-ft/month*
- *Annual Recovery Capacity Assuming 3 Months of Operation: 1,282 acre-ft/yr*
- *Average Annual Capacity for HMWD GSA: 1,282 acre-ft/yr * 21% = 250 acre-ft/yr*

HMWD-4 Utilize Surface Water In-Lieu of Groundwater – The District will use surface water in lieu of groundwater to the fullest extent possible to satisfy water demands in all years, irrespective of hydrology. The landowners within the District have been using surface water in-lieu of groundwater since before the formation of the District in the 1960's.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see Appendix U). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- Improve the understanding of the groundwater response to the implementation of P/MAs.
- Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see Appendix K) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks’ worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in Appendix V.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by HMWD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path

to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Several P/MAs have been identified and listed "**As Needed**" on Table 3 and could further reduce the deficit if needed, as summarized below:

HMWD-5 Surface Water Transfer from El Rico GSA to HMWD GSA – This P/MA involves an existing long-term common landowner transfer agreement for up to 66,000 AF State Water Project (SWP) Table A Water between Tulare Lake Basin Water Storage District (TLBWSD) and Henry Miller Water District (SWPAO# 23006). TLBWSD lies within the El Rico GSA within the Tulare Lake Subbasin, while HMWD lies within the HMWD GSA within the Kern County Subbasin. This P/MA can either provide supplemental surface water supplies during times of drought to reduce groundwater demands within the GSA or provide surplus supplies in wet years to increase banked surface water or replace prior groundwater overdraft. The P/MA yield was determined using the following calculations and assumptions:

Dry-Year Water Supply Augmentation:

- *For the dry-year water supply augmentation analysis, the P/MA was assumed to be initiated in years when the SWP allocation was less than 10%*
- *State Water Project Allocation <10% Frequency from 2014-2023: 3/10 or 30%*
- *Annual Supply Available for Transfer: 3,300 acre-ft/yr (5% of Maximum)*
- *Average Annual Water Supply Augmentation for HMWD GSA: 3,300 acre-ft * 33% = 330 acre-ft/yr*

Wet-Year Water Supply Augmentation:

- *For the wet-year water supply augmentation analysis, the P/MA was assumed to be initiated in years when the SWP allocation was between 75-100%, concurrent with surplus non-SWP surface water supplies within TLBWSD*
- *Frequency of Surplus Surface Water Supplies within TLBWSD: 1/30 or 3%*
- *Annual Supply Available for Transfer: 6,600 acre-ft/yr (10% of Maximum)*
- *Average Annual Water Supply Augmentation for HMWD GSA: 6,600 acre-ft * 3% = 220 acre-ft/yr*

Total Average Annual Water Supply Augmentation for HMWD-5:

- *Dry-Year Water Supply Augmentation: 330 acre-ft/yr*
- *Wet-Year Water Supply Augmentation: 220 acre-ft/yr*
- *Total Water Supply Augmentation: 550 acre-ft/yr*

It must be noted that given the low frequency and proportion of supply utilized from TLBWSD, implementation of this P/MA would not have a detrimental effect to TLBWSD

or prevent the El Rico GSA or the Tulare Lake Subbasin from reaching their sustainability goal. Through the 2024 Water Year, this P/MA has only been utilized for wet-year water supply augmentation and has not yet been used in a drought year to reduce groundwater demands within HMWD GSA.

Circumstances for Implementation

☑ 23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on *Tables P/MA-3* as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

☑ 23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example,

imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Since the status of all HMWD GSA P/MAs is either **Functional** or **As-Needed** and have already been approved and undergone any required public notice processes, no additional public notice processes are required to allow implementation.

Overdraft Conditions

☑ 23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-8, the HMWD GSA has a minimum target P/MA goal of approximately 1,330 AFY. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

☑ 23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.

- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in **Table 3**. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (HMWD-2, HMWSD-3, HMWD-5) come from the following sources:

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, the unused or carryover water can be stored outside the contractor’s place of service for future use. HMWD currently receives SWP water through a water supply contract (Firm Table 1 Entitlement 35,500 AF at 100% allocation) with Kern County Water Agency (KCWA), one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use. HMWD also purchases excess Article 21 water through its State Water Contractor for delivery to existing project recharge facilities using the Cross Valley Canal when such water is available.

Kern River Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. HMWD manages one of the Kern River appropriate water rights, known as the Carmel Right, owned by its largest landowner. The Carmel Right is discussed further below:

- The Buena Vista Water Storage District (BVWSD), Miller & Lux, Associates, and all modern successors own water rights in water entitled at the Second Point of Measurement on the Kern River as successors in interest to the parties of the First Part to the 1888 Miller-Haggin Agreement. These water rights are collectively known as the Second Point water right.

- The Carmel Cattle Company owned 10.415% of the Second Point water rights as a successor in interest of the parties to the Miller-Haggin Agreement. The Carmel Cattle Company conveyed 6.459% of the Second Point water rights to BVWSD and retained 3.956% of the Second Point water rights by way of the 1945 Agreement. The water right that was retained by The Carmel Cattle Company is known as the Carmel Water Right. HMWD’s largest landowner now owns and is entitled to 87.25% of the Carmel Water Right, or 3.452% of the Second Point Water Right, and delivers supplies from this right to the lands within HMWD and HMWD GSA. The Carmel Right managed by HMWD has yielded approximately 5,000 acre-ft/year on average, with lower amounts in dry years and higher amounts in normal and above-normal years.

Additional Water Sources

Typically during above-normal or wet hydrologic conditions for the Kern River, HMWD has access to additional Kern River water supplies made available through water service agreements with the City of Bakersfield and the Kern County Water Agency (KCWA). The most substantial supply comes from the Lower River Right that is owned by KCWA and offered to its member units based on the proportion of their SWP Table 1 contract. The quantity of Lower River water typically available to HMWD can range from 3,000 to 15,000 acre-feet depending on the degree of above-normal Kern River hydrology. Lastly, since certain lands within HMWD are subject to a flood servitude in favor of Buena Vista Water Storage District (BVWSD), from time-to-time HMWD has made arrangements with BVWSD to divert BVWSD’s Kern River water stored in these lands when water storage has taken place.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

HMWD GSA does not have any existing or planned in-District groundwater recharge/storage projects.

Legal Authority Required

23 CCR § 354.44(b)(7)

The HMWD is a water district, that possesses the legal authority to implement P/MAs discussed herein. HMWD GSA is also a GSAs, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges

Estimated costs for HMWD GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Henry Miller Water District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$0	\$87,500
Functional		
In-Process	\$25,000	\$50,000
As-Needed	\$0	\$5,000
Total	\$25,000	\$142,500

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, the primary means by which deficits will be addressed is through implementing P/MAs that reduce demand. Additionally, water supply augmentation from additional outside sources of water will provide protection to avoid any water supply deficits that cannot be eliminated through demand reduction alone.

Kern River GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage "deficit" of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all ~~done~~ completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning documents, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSAs. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Table 1. (Glide Path – Target Deficit Reduction)

Project and Management Action Implementation Schedule (AFY)						
Kern County Subbasin Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		2020	2025	2030	2035	2040

Figure 1. (Glide Path – P/MA Planned Deficit Reduction vs. Milestones)

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Kern River GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for Kern River GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (0 AFY) of the projected deficit of 0 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020. The optimization of water rights will increase water supply to KRGSA but may not necessarily increase water supply to the basin as whole.

Table 2. (Glide Path – Target Deficit Reduction)

Project and Management Action Implementation Schedule (AFY)						
Kern River GSA Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		2020	2025	2030	2035	2040

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example KRGSA-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits							Source(s) of Water	Legal Authority Required	Estimated Costs		
			Groundwater Levels & Storage	Groundwater Quality	Land Subsidence								Primary (AFY)		Secondary			One-time Costs	Ongoing Costs (per year)			Potential Funding Source(s)		
													Water Supply Augmentation	Demand Reduction	Water Quality Improvement	Flood Control	Water Management Flexibility or Efficiency						Mitigation Programs	Data Gap Filling/Monitoring
KRGS-6	South Kern and Old River Mutual Water System Consolidation	Two small mutual water systems in the southern KRGS will be consolidated into the City of Bakersfield's domestic water system for benefits to drinking water quality, including to disadvantaged communities (DACs). The Project will include new water distribution systems connecting the mutual water systems with the City's water system, which improve drinking water quality for the DAC.	✓			In Progress	COB, City Council Meetings & Website	DDW	In-Process	2025	2025	0	0	✓	✓			COB, DDW	None	\$7,500,000	\$78,000	COB and potential SAFER Grants		
KRGS-7	Expand Recycled Water Use in the KRGS	The City will increase recycled water use inside of the KRGS from its WWTP No. 3 in 2026 when a contract for use outside of the KRGS expires (about 72% is currently used outside of the KRGS).	✓	✓	✓	New Local Supply	Already being implemented - Reallocates water	COB, City Council Meetings & Website	None	In-Process	2026	2026-	13,407	0		✓		Recycled Water	None	NA	\$0	COB Operating Budget		
KRGS-8	Conversion of Agricultural Lands in Urban Use	Approximately 10,000 acres of current KRGS agricultural lands is expected to be urbanized; this future urban demand is already included in the projected water budget, so 100% of this agricultural water use represents a demand reduction.	✓	✓	✓	Ag to Urban Conversion	Land use changes	COB/Planning Commission, Board Meetings & Website	CEQA (As Needed)	In-Process	2038	Total by 2038	0	27,000				None	None	NA	NA	NA

Phase 1																								
KRGS-9	Implement Action Plan if Water Levels Fall Below Minimum Thresholds	A five-step action plan for addressing exceedance of GSP thresholds, including KRGS Plan Manager coordination: 1. Identify the Well(s) and investigate the Area 2. Coordinate with KRGS Plan Managers 3. Select Appropriate Management Actions or Projects for Mitigation 4. Consider Institutional Changes for Future Mitigation 5. Consider the Need for Improved Monitoring	✓			Supplemental Water Use	MT exceedance	KRGS, Board Meetings & Website	None	Ongoing	NA	2020 -	0	0	✓	✓			None	\$0	\$0	KRGS		
KRGS-10	Optimize Conjunctive Use in the KRGS	Surface water sources available to the KRGS will be prioritized for use when available, retaining the shared groundwater resources for periods when surface water is scarce. This balance of water use and higher reliance of groundwater during drought provides for increased reliability, higher groundwater levels to avoid undesirable results, and preservation of groundwater resources for other supplies are less available. Conjunctive management also encourages recharge of any excess surface water for storage and subsequent recovery to assist with drought management.	✓			Supplemental Water Use		KRGS, Board Meetings & Website	None	Ongoing	NA	2020 -	0	0	✓	✓			None	\$0	\$0	KRGS		

KRGSA-11	Support California Delta Conveyance Project to Preserve Imported Water Supplies	In its UWMP, ID4 emphasizes the need for state-wide support in improving the availability and reliability of SWP supplies. On April 29, 2019, Governor Newsom announced that his administration will develop a water resiliency portfolio (Portfolio) intended to address a range of water-related challenges facing the state. The Portfolio will address unsafe drinking water, major flood risks, severely depleted groundwater aquifers, communities with uncertain water supplies and native fish populations.	✓	✓		Supplemental Water Use		KRGSA, Board Meetings & Website	None	Ongoing	NA	2020 -	0	0	✓				None	50	50	KRGSA
KRGSA-12	Incorporate Climate Change Adaptation Strategies	As noted in its 2015 UWMP (P&P, 2016), ID4 has identified strategies that can be adapted to fit within ID4 operations to address potential uncertainties associated with the reliability of imported water supplies. In brief, climate change may result in reduced surface water that will be even more unpredictable on a year-to-year basis. As listed in the UWMP, ID4 has identified the following measures for consideration: <ul style="list-style-type: none"> • Work with retail purveyors to identify impacts of demand management measures to improve the accuracy of overall ID4 future demands. New developments are incorporating the latest water conservation features and policies that may alter the current ID4 demand projections. • Continue water recharge activities to the extent practicable to increase reliability of supplies during dry-year conditions. • Explore options to capture excess runoff in off-stream recharge facilities to conserve additional water for beneficial use that might otherwise be lost from local supplies. 	✓					KRGSA, Board Meetings & Website	None	Ongoing	NA	2020 -	0	0	✓				None	50	50	KRGSA
KRGSA-13	Support Sustainable Groundwater Supplies for KRGSA Disadvantaged Communities	The three founding KRGSA member agencies have established lines of communication and coordination with other agencies in the GSP Plan Area, many of whom provide water to DACs in the KRGSA Plan Area. In this manner, representation of these communities is considered in KRGSA actions and policies.	✓	✓				KRGSA, Board Meetings & Website	None	Ongoing	NA	2020 -	0	0		✓			None	50	50	KRGSA
KRGSA-14	Improve Groundwater Monitoring in the KRGSA Plan Area	It is the policy of the KRGSA to monitor groundwater for GSP compliance and to provide the understanding necessary for sustainable groundwater management. These actions will consist of: Improving documentation of well construction in the KRGSA Plan Area, coordinating water quality analysis through existing monitoring programs, securing inactive wells/dedicated monitoring wells, and obtaining access agreements for GSP monitoring network wells.	✓	✓				KRGSA, Board Meetings & Website	None	Ongoing	NA	2020 -	0	0		✓			None	50	50	KRGSA
KRGSA-15	Avoid Widespread Impacts to Domestic and Small Water System Wells in the Plan Area	This management action has been developed to provide clarity and more focused information on the issue of potential impacts to domestic and small water system wells. The new management action is based on an updated analysis of potential impacts to domestic and small water system wells throughout the entire Plan Area. It will consist of: Documenting Active Domestic and Small Water System Wells, Tracking the Potential for Impacts to Active Domestic and Small Water System Wells, Investigating Issues and Assisting Active Domestic and Small Water System Wells, Adjusting KRGSA Management Activities, (if Needed) and Updating Management Actions.	✓	✓				KRGSA, Board Meetings & Website	None	Ongoing	NA	2020 -	0	0		✓			None	50	50	KRGSA

Refer to Subbasin Outreach and Engagement Plan	NA	Initiating Development	2025	2025-	0	0		✓		NA	NA	50	\$45,000	KRGSA
KSB-6 (ID#4 only) (KDWD & Bakersfield not participating)	White Land Demand Management	Development of governance structure and demand reduction action for Subbasin white lands (lands not within a district or management area). Correct the water supply imbalance by setting water budgets and a linear reduction of 10% per year over the planning period of 2030-2040.	✓	✓	✓	Demand Reduction	Subbasin-wide overdraft correction.	Stakeholder Meetings Board Meetings Hearings Public Outreach & Engagement	NA	Initiating Development	2030	2030-	0	20,410	✓		✓	NA	None	50	\$10,000	KRGSA

KSB-7	Well Registry	Maintain and improve 2024 Subbasin well inventory in the DMS platform with added data from field surveys, current beneficial use determinations, and coordination with Kern County Environmental Health and DWR to track new wells, etc.	✓	✓	✓			Refer to Subbasin Outreach and Engagement Plan	NA	Ongoing	2024-	2024-	0	0		✓	✓	NA	NA	50	\$25,000	KRGSA
KSB-8	Consumptive-Use Study	Maintain and improve existing Subbasin consumptive-use study (ITRC Metric/LandIQ) for accurate estimates of water use by parcel within GSA's.	✓	✓	✓			Refer to Subbasin Outreach and Engagement Plan	NA	Ongoing	2020-	2020-	0	0		✓	✓	NA	NA	50	\$25,000	KRGSA
KRGSA-19	Conversion of Agricultural Lands	Changes in land use may also result in a decrease in agricultural demand through urbanization. Some land conversion from agriculture to urban is anticipated in Phase One associated with growth projections for Metropolitan Bakersfield. Additional changes in land use to reduce water demand could be developed in Phase Two as needed.	✓			Ag to Urban Conversion	Urbanization	KRGSA, Board Meetings & Website	CEQA (As Needed)	Ongoing	2040	As needed	0	0		✓		None	50	As needed	KRGSA	
KRGSA-20	Additional Considerations for Adaptive Management	It is recognized that demand reduction projects could have a detrimental impact on the local economy, livelihood of residents and business owners, and the well-being of Metropolitan Bakersfield and Kern County. Therefore, large-scale reductions are not proposed in Phase One and may be unnecessary for achieving the sustainability goal. At a minimum, such actions are delayed until later in the implementation period to allow water supply projects the opportunity to sustainably support current and projected growth in the beneficial uses of groundwater.	✓	✓	✓	Supplemental Water Use	As needed	KRGSA, Board Meetings & Website	None	As Needed	NA	As needed	0	0		✓		None	50	As needed	KRGSA	
KRGSA-21	Possible Water Exchange	KRGSA member agencies can perform exchanges of surface water and groundwater for benefits to water quality, including to DACs.		✓		Supplemental Water Use	As needed	KRGSA, Board Meetings & Website	None	As Needed	NA	As needed	0	0				None	50	As needed	KRGSA	
KRGSA-22	Pumping Reductions and Allocation of Agricultural Groundwater Supply	If sustainable management cannot readily be achieved through increased and optimized supplies, then pumping allocations may a helpful management tool. If needed, KDWD will explore options and opportunities for equitable allocation scenarios and engage landowners to develop workable allocations. Adjacent water districts are already developing such programs and KDWD may benefit from lessons learned and strategies incorporated by others. Agricultural demand could also be achieved if needed by growing different crop types, fallowing portions of fields, district purchase and retirement of land (and possibly used for recharge if suitable), and other strategies.	✓			Demand Reduction	Continued MT exceedance	KRGSA, Board Meetings & Website	TBD	As needed	NA	As needed	0	0		✓		None	50	As needed	KRGSA	

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA Specific P/MAs either **currently being implemented** or which **have been implemented** or **in-process** that contribute to water demand reduction include:

KRGSA-4 Urban Conservation - The State suite of legislation requiring demand reduction for urban users, referred to “Conservation is a Way of Life”, will continue to reduce the per capita urban demand. As such, future urban demand will be reduced from current modeled levels. The average urban demand for Metropolitan Bakersfield as reported by local UWMPs is 211 gallons per capita per day (gpcd). Previous estimates for future demand were estimated at 248 gpcd and basin wide GSP modelling included this estimate in all future model scenarios.

KRGSA-8 Conversion of Agricultural Lands in Urban Use - Approximately 10,000 acres of current KRGSA agricultural lands is expected to be urbanized; this future urban demand is already included in the projected water budget, so 100 percent of this agricultural water use represents a demand reduction. The estimated irrigation demand on the agricultural parcels is expected to be 2.7 AF per acre, with a total demand reduction of 27,000 AF when all the projected ag land is converted to urban use. The increase in urban demand on these parcels is already included in future population-based water demand estimates.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand

management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of Implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA Specific Projects either **currently being implemented** or **have been implemented** that contribute to water demand reduction include:

KRGSA-1 Water Allocation Plan – KDWD plans to use its full Kern River entitlement as prioritized in its Water Allocation Plan (WAP) for the Agricultural MA.

KRGSA-2 Kern River Optimized Conjunctive Use – The City plans to use its full Kern River entitlement, less current obligations, to mitigate undesirable results for water levels and water quality in the Urban MA.

KRGSA-7 Expand Recycled Water Use in the KRGSA– The City will increase recycled water use inside of the KRGSA from its WWTP No. 3 in 2026 when a contract for use outside of the KRGSA expires (about 72% is currently used outside of the KRGSA).

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KRGSA-3 Lining of Cross Valley Canal (CVC) Extension Pool No. 8 – The KCWA Improvement District No. 4 (ID4) project includes installation of approximately 5,280 lineal feet of fiber-reinforced concrete lining on an existing earthen canal to reduce seepage and improve water delivery reliability. The lining will reduce seepage, increase water delivery reliability, reduce maintenance efforts and reduce the potential for canal breaches. While the project does not bring new water into the basin, it allows for the efficient use of water and allows water managers control to effectively manage the water system to reduce loss.

KRGSA-5 ENCSD North Weedpatch Highway Water System Consolidation – Up to six small water systems in the northeast KRGSA will be consolidated into the ENCSD system for benefits to drinking water quality, including to disadvantaged communities (DACs). The project includes new water distribution systems, a new well (1,400 gpm capacity) with arsenic treatment, a storage tank, hydropneumatics tank, and a booster pump station. If TCP is detected in the new well, the grant will also fund a TCP

treatment system. All wells with water quality violations will be properly abandoned according to Kern County Environmental Health regulations.

KRGSA-6 South Kern and Old River Mutual Water System Consolidation – Two small mutual water systems in the southern KRGSA will be consolidated into the City of Bakersfield’s domestic water system for benefits to drinking water quality, including to disadvantaged communities (DACs). The Project will include new water distribution systems connecting the mutual water systems with the City’s water system, which will improve drinking water quality for the DAC.

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year ~~(ft/yr)~~ with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity

Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing

- tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
 - d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
 - e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin, as part of the 2024 GSP amendment process, developed a more accurate well inventory based on available databases and field verifications. This management action will continue to provide improvements and maintenance of the Subbasin’s existing well inventory and house the well registry within the Kern County Subbasin data management system. At least annually, the Subbasin will update the system using DWR/County well permit information and well surveys. Additional details regarding the data sources and methodologies used to develop the improved well inventory can be found in Section 14.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by KRGSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Circumstances for Implementation

☑ 23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

☑ 23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review.

Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown on Table 14-2 the KRGSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (KRGSA-1, KRGSA-2, KRGSA-3, KRGSA-7) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be delivered from the FKC through the CVC. KRGSA is a fourth priority non-CVP SOD Contractor that can take CVP water under certain conditions. The Friant-Kern Canal capacity has been recently hampered by subsidence which has limited available supplies. Remediation efforts are underway and should restore access to these critical supplies by 2030.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor's place of service for future use. KRGSA currently receives SWP water through a water supply contract (Table 1 Entitlement 25,500 AF for KDWD and 82,946 AF for ID4) with KCWA, one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use. ID4 is a SWP wholesaler and received.

The Henry C. Garnett Water Purification Plant (HCGWPP), owned and operated by ID4, primarily treats imported water for municipal use. SWP water is conveyed directly to the plant as needed. When excess SWP water is available, ID4 recharges it – both inside and outside of the KRGSA Plan Area – for subsequent recovery and treatment at the HCGWPP. ID4 also diverts Kern River water and CVP water to the plant through exchanges. Water from the HCGWPP is distributed to Cal Water, City of Bakersfield, ENCSD, and NORMWD.

Recycled Water

The City of Bakersfield treats municipal wastewater for a variety of reuses in the Plan Area. Tertiary treated wastewater is recycled to irrigate parkland and sports fields within

the KRGSA Plan Area that would have otherwise used potable water. Recycled water use is projected to increase in the City. In addition to irrigation, de-nitrified secondary treated wastewater is used to recharge groundwater via unlined ponds (Stetson, 2017). Previous recycled water was exported from KRGSA but future projects are designed to maximize recycled water use within the KRGSA Plan Area.

Appropriative Water Rights

KRGSA agencies have a long history of conjunctive use in the Plan Area. Local surface water sources (primarily the Kern River) and imported water sources (mostly SWP) are managed for direct use and groundwater recharge. These actions serve to decrease reliance on groundwater and to replenish it for times when surface water supplies are limited. In this manner surface water and groundwater are managed conjunctively to optimize water supply for beneficial uses in the KRGSA Plan Area.

Almost all surface supplies available to the KRGSA are managed by the City of Bakersfield, ID4, and KDWD.

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

Distribution of water within the First Point service area of the Kern River was adjudicated in the 1900 Shaw Decree. Over the years, Kern River water has been apportioned based on entitlements determined through canal company consolidations, water rights transfers and acquisitions, court decisions, and agreements. In 1888, two permanent stream gage stations, First Point and Second Point, were established to measure flow in the Kern River on a real-time basis. The First Point daily discharge is used to allocate water among various Kern River interests, referred to as First Point diverters, Second Point diverters, and Lower River diverters. The Second Point of measurement is approximately 20 miles downstream and is used to check upstream water use (and entitlements) with diversion rights on the Lower River (Boyle, 1975). Second Point is shown on Figure 1-1 and marks the western edge of the KRGSA Plan Area.

KDWD and City of Bakersfield are successors-in-interest to all First Point water rights holders. Buena Vista Water Storage District (BVWSD) is successor-in-interest to all

Second Point water right holders. KCWA is successor-in-interest to all Lower River water right holders (downstream of Second Point). The City monitors, manages, and records flows and diversions in the River on behalf of the Kern River Watermaster for all water users.

3rd Party Programs

KRGSA has long operated 3rd party banking program for several Kern County and outside of Kern County agencies. Over the past several years more interest has been expressed in participating in KRGSA projects for drought protection needs. These supplies come from the above three identified sources and have provided groundwater supply for KRGSA and drought protection for the 3rd party.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

The water supply benefit for water recharge and optimization projects have been estimated based on observed benefits. KRGSA-1 and KRGSA-2 have been implemented and the observed average annual increase in recharge to the KRGSA (2018-2023) is assumed to continue.

The estimated benefit from urban conservation was calculated by using revised future estimates of per capita demand published in the 2020 Urban Water Management Plans (UWMPs) to the previous estimates used to simulate future conditions. This estimate may be conservative as additional legislation may continue to decrease per capita demands.

The benefit of changes in the recycled water system is based on the current volume of recycled water that is currently exported from the KRGSA area. The project would increase recycled water within KRGSA and limit the export.

The benefit for agricultural land converted to urban is assumed to be 2.7 AFY/Ac, the expected ET demand of the crops taken out of projects. The expected urban demand expected on these parcels are already included in the future growth projections for the water retailers.

Legal Authority Required

[23 CCR § 354.44\(b\)\(7\)](#)

The KRGSA is comprised of Kern Delta Water District, City of Bakersfield, and Kern County Water Agency (ID4) and collectively possess the legal authority to implement P/MAs discussed herein. KRGSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

☑ 23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges.
- Grant funding from sources including DWR, and others.

Estimated costs for KRGSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Kern River GSA	Estimated Costs	
	One-time	Annual
Implemented	\$7,000,000	\$50,000
Functional		
In-Process	\$7,525,000	\$183,000
As-Needed		
Total	\$14,525,000	\$233,000

Management of Recharge and Groundwater Extractions

☑ 23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside

sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. The formation of a groundwater budget program would likely include mechanisms to allow for trading or exchange of pumping allocations within designated areas, subject to constraints dictated by groundwater conditions observed within the Monitoring Network and policies developed by the respective Board of Directors. Through this combination of increased recharge during wet years and demand reduction, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Kern-Tulare Water District GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Kern-Tulare Water District GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for KTWD GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (243 AFY) of the projected deficit of 970 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2025.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example RRB-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits							Source(s) of Water	Legal Authority Required	Estimated Costs		
			Groundwater Levels & Storage	Groundwater Quality	Land Subsidence								Primary (AFY)		Secondary							One-time Costs	Ongoing Costs (per year)	Potential Funding Source(s)
													Water Supply Augmentation	Demand Reduction	Water Quality Improvement	Flood Control	Water Management Flexibility of Efficiency	Mitigation Programs	Data Gap Filling/Monitoring					
<i>Projects</i>		Implemented	Functional	In-Process	As-Needed							Implemented	Functional	In-Process	As-Needed									
KTWD-1	Connect Rag Gulch and Ave 4 Systems	Construction of 0.5 miles of 15-inch pipeline between the Avenue 4 distribution system and the Rag Gulch distribution system increases the delivery capability to 2,089 acres in the Rag Gulch and Avenue 4 distribution systems from 4.0 to 4.9 gpm/acre. The project will increase surface water deliveries by an estimated 260 AF per year.	✓	✓	✓	Exercise of Rights		Stakeholder Meetings Board Meetings		Implemented	2023	2024-	260	✓	✓				CVP supplies	None	\$180,000	\$0	KTWD Water Charges	
KTWD-2	Quinn Pumping Plant and Pipeline	Construction of the Quinn Pumping Plant and Pipeline includes a 400 HP pumping plant, 3.5 miles of distribution system piping, and 4 turnouts. The project will improve delivery capability to 3,544 acres to increase surface water deliveries and reduce groundwater pumping by an estimated 1,130 AF per year in years of adequate water supply.	✓	✓	✓	Exercise of Rights		Stakeholder Meetings Board Meetings Prop 218 Special Assessment	Complete	In-Process	2025	2025-	1130	✓	✓			CVP supplies	None	\$2,500,000	\$0	KTWD Special Assessment		
KTWD-3	Improved Conveyance to Ave 24	Constructs the necessary improvements to the North distribution system to allow for 177 acres that are within the District and reliant upon groundwater to be added to the Service Area. The Project includes installation of 0.7 miles of 18-inch diameter pipeline and replacement of the 16-inch diameter pipeline crossing of Avenue 24 with a 30-inch pipeline. Project will increase surface water deliveries by an estimated 480 AF per year.	✓	✓	✓	Exercise of Rights		Stakeholder Meetings Board Meetings Prop 218 Special Assessment	Complete	In-Process	2025	2025-	480	✓	✓			CVP supplies	None	\$600,000	\$0	KTWD Special Assessment		
KTWD-4	Replace Twin Pipes Pumping Plant	Increasing the horsepower at the Twin Pipes pumping plant from 200 HP to 400 HP will improve the delivery capability to 1,488 acres in the Twin Pipes service area from 3.8 gpm/acre to 5.2 gpm/acre. The project will increase surface water deliveries by an estimated 270 AF per year.	✓	✓	✓	Exercise of Rights		Stakeholder Meetings Board Meetings		In-Process	2025	2025-	270	✓	✓			CVP supplies	None	\$400,000	\$0	KTWD Water Charges

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 970 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

P/MAs either **currently being implemented** or **which have been implemented** or **in-process** that contribute to water demand reduction include:

KTWD-8 Modify District Pricing Structure – Includes reducing groundwater pumping by providing a pricing mechanism that causes groundwater to cost more than surface water. The District Implemented a “groundwater charge” for every acre-foot pumped and install meters on all ag wells. The District calculates demand reduction of 5,580 AFY through this P/MA.

Each year the KTWD’s Board of Directors sets the surface water price for water users based on the blended water rates of the various sources of KTWD’s water supply. This price is highly dependent upon hydrology and availability of water supplies. There are times when the cost of District water is more expensive than the cost to pump groundwater. During these times, some water users choose to pump groundwater instead of using surface water due to the cost difference.

The most affordable way to reduce groundwater pumping is to provide a pricing mechanism that causes groundwater to cost more than surface water. This is accomplished by implementing a “groundwater charge” for every acre-foot pumped. Water Code §35533 provides the District the authority to collect groundwater charges. Revenue from the groundwater charge could be used to implement management actions or to reduce the cost to deliver surface water from the District.

Implementing the groundwater pumping charge required the following be accomplished:

1. Conducted a “Majority Protest” procedure under Proposition 218.
2. Installed meters on all groundwater wells (or use an equivalent form of metering).
3. Set up procedures to read groundwater meters and charge for groundwater pumping.

KTWD began charging for groundwater in March 2024.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach

efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land's relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin's ability to meet its sustainability goal.

Water Supply Augmentation P/MA's

Water Supply Augmentation P/MAs are the secondary means of implementation of a "Glide Path" that will result in closing the balance of the currently identified "deficit" by 970 AFY by the January 2040 GSP implementation deadline.

GSA-specific Projects either **currently being implemented** **or have been implemented** or **in-process** that contribute to water supply augmentation include:

KTWD-1 Connect Rag Gulch and Ave 4 Systems - Includes construction of 0.5 miles of 15-inch pipeline between the Avenue 4 distribution system and the Rag Gulch distribution system. This increases the delivery capability to 2,089 acres in the Rag Gulch and Avenue 4 distribution systems from 4.0 to 4.9 gpm/acre. The project will increase surface water deliveries by an estimated 260 AF per year. This project was completed in 2023.

KTWD-2 Quinn Pumping Plant and Pipeline - Includes construction of the Quinn Pumping Plant and Pipeline including a 400 HP pumping plant, 3.5 miles of distribution system piping, and 4 turnouts. The project will improve delivery capability to 3,544 acres to increase surface water deliveries and reduce groundwater pumping by an estimated 1,130 AF per year in years of adequate water supply.

KTWD-3 Improved Conveyance to Ave 24 - Includes construction of a necessary improvement to the North distribution system to allow for 177 acres that are within the District and reliant upon groundwater to be added to the Service Area. The Project includes installation of 0.7 miles of 18-inch diameter pipeline and replacement of the 16-inch diameter pipeline crossing Avenue 24 with a 30-inch pipeline. Project will increase surface water deliveries by an estimated 480 AF per year.

KTWD-4 Replace Twin Pipes Pumping Plant - Increasing the horsepower at the Twin Pipes pumping plant from 200 HP to 400 HP will improve the delivery capability to 1,488

acres in the Twin Pipes service area from 3.8 gpm/acre to 5.2 gpm/acre. The project will increase surface water deliveries by an estimated 270 AF per year.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using

either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K** to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.

- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Several projects and management actions have been identified and listed “As Needed” on Table 4 and could reduce the deficit by up to 14,470 AFY if needed as summarized below:

KTWD-5 Provide Full Service to Southern Service Area - Replacement of Cecil Pumping Plant and Pipeline, construction of Intertie Pumping Plant and Pipeline, and construction of Grapefruit Pumping Plant and Pipeline to satisfy peak season irrigation demands to

over 13,500 acres in the southern portion of the District. Project is estimated to increase the annual delivery capability of the District by 9,470 AF in wet and normal years.

KTWD-6 Produced Water Project- Phase 2 - The District has historically accepted produced water to provide surface water to the District and has the opportunity to obtain additional sources of produced water.

KTWD-7 In-District Surface Storage - The District has selected two potential reservoir sites with a total capacity of 8,000 AF to capture wet year water.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, KTWD GSA has a minimum target P/MA goal of 970 AFY. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.

- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 1. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide

Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Potential water supplies that feed water augmentation P/MAs (KTWD-1, KTWD-2, KTWD-3, KTWD-4) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. KTWD has two Cross Valley Contracts with the United States Bureau of Reclamation (Reclamation) for a combined total of up to 53,300 acre-feet per year of CVP water and a Friant Class 2 Contract for up to 5,000 acre-feet per year of CVP water. KTWD also has access to water from the following associated sources: Recovered Water Account (RWA), Unreleased Restoration Flows (URF), Recapture & Recirculation (R/R), and Section 215 water. KTWD also purchases Class 1 and Class 2 water supplies from other Friant Contractors and purchases CVP water from other South of Delta contractors.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor’s place of service for future use. KTWD has received SWP water through water transfer agreements with various State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are

available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

KTWD currently receives Kern River water when it is available through water service agreements with the City of Bakersfield.

Produced Water

KTWD executed a 20-year contract with Hathaway, LLC in 2016 to receive produced water. The District currently receives about 2,400 acre-feet per year of water from this source on the east side of the District, which is delivered to the District's Big 4 reservoir to be blended with other water sources before being distributed. The source of oilfield produced water is from exempted aquifers beneath and hydrologically separated from the fresh-water bearing zones of the basin.

3rd Party Programs

KTWD has developed long-term groundwater banking programs with North Kern Water Storage District (North Kern), Rosedale-Rio Bravo Water Storage District (Rosedale-Rio Bravo), and West Kern Water Storage District (West Kern) to deliver excess water when surface supplies are available and to extract groundwater during years of inadequate supplies.

The North Kern project yields an annual dry year supply of up to 5,000 acre-feet. The agreement requires the KTWD to bank water before it can be extracted and leave 10 percent of the water banked in North Kern to account for losses.

The Rosedale-Rio Bravo project yields an estimated dry year annual supply of up to 9,000 acre-feet. The agreement requires KTWD to bank 2.13 acre-feet for each acre-foot extracted and to bank water before it can be extracted.

The West Kern project yields an estimated dry year annual supply of up to 2,000 acre-feet. The agreement requires KTWD to bank 2 acre-feet for each acre-foot extracted and bank water before it can be extracted.

Legal Authority Required

23 CCR § 354.44(b)(7)

The KTWD is a water district, that possesses the legal authority to implement P/MAs discussed herein. KTWD GSA is also a GSAs, per California Water Code (CWC) §

10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments, water charges and/or groundwater charges.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for KTWD GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Kern-Tulare Water District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$680,000	\$60,000
Functional		
In-Process	\$3,525,000	\$105,000
As-Needed	\$60,900,000	\$0
Total	\$65,105,000	\$165,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges. Through this combination of increased recharge during wet years and demand reduction, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Kern Water Bank GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage "deficit" of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning documents, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

(b) Implementation Glide Path – Kern Water Bank GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County (i.e., by January 2040). The KWB GSA individual P/MAs have already been implemented and the results, also known as a “Glide Path,” have been developed as summarized for KWB GSA Table 2 below and illustrated on Figure 3. As shown, this “Glide Path” is horizontal because the KWB GSA, due to operational constraints, cannot have a groundwater deficit. However, water stored in the KWB GSA can help KWBA members reduce their deficits.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example RRB-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits						Source(s) of Water	Legal Authority Required	Estimated Costs

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” for the Subbasin that will result in closing the currently identified “deficit” of 372,000 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented or in-process** that contribute to water demand reduction include:

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of Implementation of a “Glide Path” for the Subbasin that will result in closing the balance of the currently identified “deficit” of 372,000 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA Specific Projects that **have been implemented** by the KWB GSA that contribute to water supply augmentation include:

KWBA-1 Kern Water Bank Recharge and Recovery Enhancement Project – This project included the construction of 3 wells and associated pipelines and 2 recharge basins (189 acres). This project provides approximately 1730 AF/month recharge capacity and 910 AF/month recovery capacity.

KWBA-2 Kern Water Bank Recharge Enhancement Project – This project included the construction of 4 pumping facilities on the Kern Water Bank Canal and 1,025 acres of recharge basins. The project will capture of up to 107,900 AF/yr of wet period water.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year (ft/yr) with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to

subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KWBA-3 Project Recovery Operations Plan – This is a domestic, small community, and irrigation well mitigation program to address impacts related to a temporary lowering of water levels resulting from KWB recovery operations during prolonged droughts on adjacent lands. This management action includes public outreach, emergency water supplies, and mitigation measures that have included replacement wells, pump replacement and/or lowering, and connection to urban purveyors. The triggers for mitigation are very favorable to the well owners – as little as a 10% contribution to overall lowered water levels will result in the provision of mitigation.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks’ worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by KWB GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the Kern Subbasin projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA and Subbasin may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be

evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 1 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different Subbasin P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for

example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 9.1.2.4 and shown in Table 142, the KWB GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. The KWB GSA specific projects, already implemented, involve increased surface water storage. These benefits will be quantified by direct measurements and the benefits will be measurable and certain. For those Subbasin-wide P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the Subbasin P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the

“Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Water supplies that increase water storage P/MAs (KWBA-1 and KWBA-2) are secured by our members. These supplies typically come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be purchased by KWBA members and delivered from the Friant-Kern Canal through the CVC and Kern River channel to KWB GSA facilities. The Friant-Kern Canal capacity has been recently hampered by subsidence which has limited available supplies. Remediation efforts are underway and should restore access to these critical supplies by 2030.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor’s place of service for future use. KWB GSA members currently receive SWP water through water supply contracts with Kern County Water Agency (KCWA), one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased and stored for future use. KWB GSA members may purchase excess Article 21 water through the KCWA.

Kern River

Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion when water (1) is offered to all takers willing to sign a Notice/Order; or (2) is offered to the Kern River/California Aqueduct Intertie for

disposal; or (3) is expected to flood farm acreage; or (4) is expected to be delivered into the Kern River Flood Channel for disposal out-of-county. The KWBA secured a 180-day Permit from the SWRCB to take such water in 2023. KWBA GSA members may also purchase Kern River water from rights holders.

3rd Party Programs

The KWBA GSA does provide for second priority use. However, access to facilities is typically very limited due to the KWBA members' needs.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Water supply augmentation benefits for projects KWBA-1 and KWBA-2 were determined by an independent engineering evaluation incorporated into state grant proposal submittals.

Legal Authority Required

23 CCR § 354.44(b)(7)

The KWBA GSA is a joint powers authority that possesses the legal authority to implement all GSA powers described in California Water Code (CWC) § 10725 through 10726.8.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- KWBA GSA participant assessments, and/or
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for KWB GSA P/MA's by implementation status are summarized in Table 4. The costs for KWBA-1 and KWBA-2 are based on actual expenditures. These costs include "one-time" costs and ongoing costs. The one-time and on-going costs for the Subbasin P/MAs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, maintenance, or any other costs required to initiate and sustain a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Kern Water Bank GSA	Estimated Costs	
	One-time	Annual
Implemented	\$15,400,000	\$89,000
Functional		
In-Process	\$25,000	\$105,000
As-Needed		
Total	\$15,425,000	\$194,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which Subbasin deficits will be addressed is through implementing P/MAs that reduce demand (e.g., KSB-6) and augment supplies from additional outside sources of water, particularly during normal to wet years. The two KWB GSA specific projects (KWBA-1 and KWBA-2) take advantage of additional wet-year supplies that have already proven to be available. The KWB GSA portfolio also includes policy-based management actions aimed at demand reduction in white lands (KSB-6). The KWB GSAs' operational constraints and P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in surface water storage during drought will be offset by increases in groundwater levels and surface water storage during other periods.

North Kern Water Storage District GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 1. (Glide Path – P/MA Planned Deficit Reduction vs. Milestones)

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – North Kern Water Storage District GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for the North Kern Water Storage District GSA (NKWSD GSA) in Table 2 below and illustrated on Figure 3. The “Glide Path” is aimed to address 25 percent of the projected deficit of during each five-year Milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSP Area. NKWSD GSA has no projected deficit, as indicated in Table 2, so the projected deficit at each five-year milestone is zero AF. The anticipated P/MA implementation schedule is forecasted to have exceeded the target deficit reduction as early as 2020. Please note that the last row of Table 2 shows an increasing volume of surplus water resulting from NKWSD GSA P/MA implementation. As NKWSD GSA does not have a historical deficit, P/MA demand reduction and supply augmentation will provide resilience in the event of drier conditions or other unforeseen changes to the GSA’s water balance.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example NKWSD-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs that have either **been implemented** or **are currently being implemented** or **in-process** and contribute to water demand reduction include:

NKWSD-3 Landowner Subsurface/Surface Recharge Program = Implementation of joint Landowner and District program to expand District groundwater recharge using landowner owned facilities.

NKWSD-4 SCADA Automation and Evapotranspiration Measurement Improvements = Develop automation and remote sensing for ET monitoring and improved management of surface water conveyance."

NKWSD-10 RRID Groundwater Recharge Project = Construction and Implementation of water recharge basins for the RRID management area. Approximately 450 acres of crops will be removed and replace by recharge facilities.

NKWSD-15 Conversion of Agricultural Land to Urban Use in RRID = Conversion of agricultural land to urban use within the limits of each city to reduce groundwater use due to the decreased demand.

NKWSD-16 Urban Water Conservation Program = Implementation of urban indoor and outdoor usage cap as required by SB 606 and AB 1668.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand

management in the 2025-2030 period will not preclude the Subbasin's ability to meet its sustainability goal.

Water Supply Augmentation P/MA's

Water Supply Augmentation P/MAs are the secondary means of implementation of a "Glide Path" that will result in closing the balance of the currently identified "deficit" by **0 AFY** by the January 2040 GSP implementation deadline.

GSA-specific P/MAs that have either **been implemented** or are **currently being implemented** or **in-process** and contribute to water supply augmentation include:

NKWSD-1 Beneficial Reuse of Oilfield Produced Water = Oilfield produced water of sufficient quality for beneficial reuse used as source water for groundwater recharge. 9,000 AFY expected annually, 6,500 of which will be transferred to RRID.

NKWSD-2 Allocation of Available NKWSD Supplies to RRID = Transfer a portion of groundwater banked oilfield produced water from NKWSD to RRID benefit.

NKWSD-3 Landowner Subsurface/Surface Recharge Program = Implementation of joint Landowner and District program to expand District groundwater recharge using landowner owned facilities.

NKWSD-5 Calloway Canal Improvements: Lining Snow Rd. to 7th Standard Rd. = Concrete lining of canal to increase surface water reliability and prevent loss from seepage.

NKWSD-6 Calloway Canal Improvements: lining 7th Standard Rd. to 8-1 Pump Station = Concrete lining of canal to increase surface water reliability and prevent loss from seepage.

NKWSD-7 Groundwater Banking Conveyance Improvements to NKWSD Recharge and Recovery = Improvements to existing well network for return capacity of recharged water to District's banking partners.

NKWSD-8 Calloway Canal Improvements: lining Fruitvale Ave. to CVC Intertie = Concrete lining of canal to increase surface water reliability and prevent loss from seepage.

NKWSD-9 Calloway Canal Improvements: lining Case St. to Fruitvale Ave. = Concrete lining of canal to increase surface water reliability and prevent loss from seepage.

NKWSD-10 RRID Groundwater Recharge Project = Construction and Implementation of water recharge basins for the RRID management area. Approximately 450 acres of crops will be removed and replaced by recharge facilities.

NKWSD-11 Expanded Water Banking Program = Use of available capacity in existing facilities and development of additional recharge and recovery facilities.

NKWSD-12 Poso Creek Weir = Installation of a concrete weir on Poso Creek to replace the earthen structure.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

NKWSD-13 Ongoing Evaluation of Groundwater Levels and Water Quality Trends = Monitor WQ to determine if a correlation for degradation develops as a result of declining water levels.

NKWSD-14 Refinement of Water Budget Components = Improvement of monitoring and measurements to refine the accuracy of measurement or calculation of inflow and outflow components of district-level water budget. Will also refine Subbasin Model and water budget.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see Appendix U). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see Appendix K) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in Appendix V.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by NKWSD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the

GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that

related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

☑ 23 CCR § 354.44(b)(2)

As discussed in Section 414.1.2 and shown in Table 14-2, the NKWSD GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

☑ 23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 141 *P/MA-3*. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit will be quantified directly through flow measurement. For P/MAs that involve indirect supply augmentation through increased groundwater storage or banking, quantification of the benefit will require tracking of project water deliveries and estimates of indirect supply increases based on specific project conditions. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against the recent historical and projected condition without the P/MA in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide

Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

☑ 23 CCR § 354.44(b)(6)

Potential water supplies for water supply augmentation P/MAs (NKWSD-1, NKWSD-2, NKWSD-3, NKWSD-7, NKWSD-10, and NKWSD-11) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be delivered from the Friant-Kern Canal through the CVC. NKWSD is a fourth priority non-CVP SOD Contractor that can take CVP water under certain conditions. The Friant-Kern Canal capacity has been recently hampered by subsidence which has limited available supplies. Remediation efforts are underway and should restore access to these critical supplies by 2030. NKWSD implements groundwater banking programs and will expand those programs with CVP Contractors and therefore receives supplies via the Friant-Kern Canal.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by NKWSD and include Kern River and Poso Creek water rights. Other than NKWSD’s pre-1914 Kern River rights, these water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

NKWSD is a Kern River water rights holder with the right to divert Kern River water for agricultural benefits and groundwater storage. NKWSD can also access additional Kern River water when it is available for groundwater recharge through other Kern River water contracts or agreements with other Kern River water right holders. Kern River “release”

or “flood” water is also available to NKWSD when water (1) is offered to all takers willing to sign a Notice/Order; or (2) is offered to the Kern River/California Aqueduct Intertie; or (3) is expected to flood farm acreage; or (4) is expected to be delivered into the Kern River Flood Channel for flow out-of-county. NKWSD also takes this released water from the Kern River for groundwater recharge if and when available. Additionally, NKWSD has an active permit to divert flows from Poso Creek and can take additional flows under flood conditions.

Oilfield Produced Water

NKWSD has an active partnership with a local oil and gas company that produces good quality water as part of their process. This oilfield produced water is treated for non-potable uses and received by NKWSD for agricultural irrigation under an existing Waste Discharge Permit.

Legal Authority Required

23 CCR § 354.44(b)(7)

The NKWSD is a water storage district, that possesses the legal authority to implement P/MAs discussed herein. NKWSD GSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- Existing NKWSD resources.
- NKWSD landowner financial sponsorship.
- Financial sponsorship from private stakeholders, cities, and Kern County.

- Project partners, specifically the Rosedale Ranch Irrigation District (RRID).
- NKWSD assessments and/or water tolls.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for NKWSD GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

North Kern Water Storage District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$1,860,432	\$1,800,000
Functional		
In-Process	\$64,856,060	\$1,597,500
As-Needed		
Total	\$66,716,492	\$3,397,500

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which future potential deficits and total Subbasin deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. Through this combination of increased recharge during wet years and demand reduction, the GSAs’ P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

The formation of a potential groundwater budget program would likely include mechanisms to allow for trading or exchange of pumping allocations within designated areas, subject to constraints dictated by groundwater conditions observed within the Monitoring Network and policies developed by the respective Board of Directors.

This page intentionally left blank.

Olcese Water District GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- 23 CCR § 354.44(a)
- 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Table 1. (Glide Path – Target Deficit Reduction)

Kern County Subbasin Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		Project and Management Action Implementation Schedule (AFY)				
		2020	2025	2030	2035	2040
Projected Deficit		-372,000				
Target Deficit Reduction (%)		0	25%	50%	75%	100%
Projected Deficit No P/MA's		372,000	372,000	372,000	372,000	372,000
Deficit Reduction "Glide Path" Milestones		-372,000	-279,000	-186,000	-93,000	0
Project and Management Action, by Type (AFY)

(b) Implementation Glide Path – Olcese Water District GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for Olcese Water District GSA in Table 2 below and illustrated on Figure 3. (The Olcese GSA does not have a current or projected deficit, nor P/MAs targeted at reducing a deficit). This “Glide Path” is aimed to address 25 percent (0 AFY) of the projected deficit of 0 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example Olcese-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

KSB-4	Coordination with Basin Study	Coordination with local GSA's to gain a better understanding of the Kern Subbasin and how best to manage for sustainability, native yield, subsurface flow, and evapotranspiration. The further development of the data management system to improve data access and transparency.	✓	✓	✓		Supporting data collection, reviewing and validating results with GSA-specific data.	NA	NA	Ongoing	2025	2025-	0	0			✓	NA	NA	\$25,000	\$0	OWD	
KSB-5	Domestic Well Mitigation	Development of a subbasin domestic and small community well mitigation program to assist with financial aspects of emergency water supplies and well improvement and replacement due to lowering of groundwater levels.	✓	✓			When declining groundwater levels impact domestic or small community wells.	Refer to Subbasin Outreach and Engagement Plan	NA	Initiating Development	2025	2025-	0	0			✓	NA	NA	\$0	\$45,000	OWD	
KSB-6	White Land Demand Management	Development of governance structure and demand reduction action for Subbasin white lands (lands not within a district or management area). Correct the water supply imbalance by setting water budgets and a linear reduction of 10% per year over the planning period of 2030-2040.	✓	✓	✓	Demand Reduction	Subbasin-wide overdraft correction.	Stakeholder Meetings Board Meetings Hearings Public Outreach & Engagement	NA	Initiating Development	2030	2030-	0	20,410	✓		✓	NA	None	\$0	\$10,000	OWD	
KSB-7	Well Registry	Maintain and improve 2024 Subbasin well inventory in the DMS platform with added data from field surveys, current beneficial use determinations, and coordination with Kern County Environmental Health and DWR to track new wells, etc.	✓	✓	✓			Refer to Subbasin Outreach and Engagement Plan	NA	Ongoing	2024-	2024-	0	0			✓	✓	NA	NA	\$0	\$25,000	OWD

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented** or **in-process** that contribute to water demand reduction include:

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of Implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

As stated above the Olcese Water District GSA is not experiencing a deficit. Therefore, no GSA-specific water supply augmentation projects are planned.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

Olcese-1 Shallow Monitoring Well Installation – The Olcese Water District GSA completed the installation of a shallow monitoring well in the vicinity of Olcese Water District Well #2 for purposes of monitoring groundwater levels in the Shallow Alluvium aquifer to support evaluation of the potential hydraulic connection between the Olcese Sand Aquifer Unit and the Shallow Alluvium.

Olcese-2 Second Shallow Monitoring Well Installation – The Olcese Water District GSA may install a second shallow monitoring well in the vicinity of Cottonwood Creek and conduct monitoring, contingent upon results from P/MA Olcese-1 and Olcese PMA-4.

Olcese-4 Olcese Sand / Shallow Alluvium Hydraulic Connection Study – Following the installation of the shallow monitoring well under P/MA Olcese-1, the Olcese Water District GSA began conducting a study of the potential hydraulic connection between the Olcese Sand Aquifer Unit and the Shallow Alluvium. Data collection is ongoing.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025, with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks’ worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or Landy for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by Olcese Water District GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. While not applicable to the Olcese Water District GSA P/MAs which do not have water supply expected benefits, in general if either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions

as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

One project and management action has been identified and listed “As Needed” on Table 3. This P/MAs focus on data gap filling and therefore will not result in any demand reduction.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 2, the Olcese Water District GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).

- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in

place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the water supply augmentation and demand reduction P/MAs described herein (none of which are applicable to the Olcese Water District GSA) are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

The Olcese Water District GSA P/MA’s expected benefits are related to data gap filling; specifically, the expected benefits of the Olcese-1 (Implemented) and Olcese-4 (In-Process) P/MAs are improved understanding of hydrologic conditions in the Shallow Alluvium aquifer and its potential connection to the deeper Olcese Principal Aquifer. Evaluation of benefits of the Olcese Water District GSA P/MAs will be based on the degree to which Olcese-4 hydraulic connection study yields improved understanding of the potential hydraulic connection using the best available science and information.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

The Olcese Water District GSA does not have any P/MAs with water supplies that feed water recharge P/MAs.

Legal Authority Required

23 CCR § 354.44(b)(7)

The Olcese Water District is a water district that possesses the legal authority to implement P/MAs discussed herein. Olcese Water District GSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, and the GSA possesses the legal authority necessary to implement the demand management P/MAs that may be defined for its jurisdictional area in the future.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The

one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- Olcese Water District general funds.

Estimated costs for Olcese Water District GSA P/MAs by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Olcese Water District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$40,000	\$52,500
Functional		
In-Process	\$75,000	\$110,000
As-Needed	\$40,000	\$2,500
Total	\$155,000	\$165,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, the Olcese Water District GSA is in a state of approximate water supply/demand balance (i.e., net zero conditions, based on the “checkbook” water budget planning tool). Under the projected Baseline and 2030 (and 2070) Climate Change Scenarios no water supply deficit is projected to occur within the GSP area. However, in general terms, one primary means by which deficits can be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Some projects take advantage of additional wet-year supplies that are assumed to be available as capacity increases. Those P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

As the Olcese Water District GSA does not have a projected deficit, its P/MAs are focused on data gap filling and will serve to improve understanding of the hydrogeologic conditions within the GSA area. Subbasin-wide, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Pioneer GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage "deficit" of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning documents, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Table 1. (Glide Path – Target Deficit Reduction)

Kern County Subbasin Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		Project and Management Action Implementation Schedule (AFY)				
		2020	2025	2030	2035	2040

(b) Implementation Glide Path – Pioneer GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for Pioneer GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (0 AFY) of the projected deficit of 0 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example RRB-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits						Source(s) of Water	Legal Authority Required	Estimated Costs

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA specific P/MAs either **currently being implemented** or **which have been implemented** or **in-process** that contribute to water demand reduction include:

Demand reduction P/MAs are not applicable to the Pioneer GSA.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix V**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of Implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA Specific Projects either **currently being implemented** or **have been implemented** that contribute to water supply augmentation include:

Water Supply Augmentation P/MAs are not applicable to the Pioneer GSA.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year (ft/yr) with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

Pio-1 Installation of a Monitoring Well in North Pioneer – Pioneer GSA identified a monitoring data gap on North Pioneer. Installation of a cluster monitoring well was installed in 2019.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking MOUs, which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks’ worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by Pioneer GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts. Three projects and management actions have been identified and listed “As Needed” or “In-Process” on Table 3 and help maintain the Pioneer GSA’s sustainability.

Pio- 2 Continued Participation in Basin-Wide Coordination – The Pioneer GSA will continue to coordinate with all other GSA's within the Kern Subbasin to address regulatory requirements and determination. This will allow for the flexibility to adapt to future conditions so that the Pioneer GSA can continue its successful and sustainable management of groundwater resources.

Pio- 3 Continued Balanced Pumping and Recharge – The Pioneer GSA and Pioneer Project will continue balanced pumping and recharge as part of its standard operating procedure through GSP implementation. Through the continued successful balancing and operation of pumping and recharge activities, the Pioneer GSA will be able to adapt to any future Subbasin conditions to maintain its sustainable management of groundwater resources.

Pio-4 Increases Surface Spreading Losses from 6 to 10 Percent – This management action would explore the feasibility of increasing the fixed loss rate of surface spreading from 6 to 10 percent.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the Pioneer GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.

- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (Pio-3) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau

of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be delivered from the Friant-Kern Canal through the CVC to the Pioneer Project on behalf of the Pioneer Project Participants for recharge and future recovery for use on lands within Kern County.

State Water Project

DWR delivers water to 29 State Water Project (SWP) Contractors, including 21 south of the Sacramento-San Joaquin River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor's place of service for future use. Pioneer Project Participants receive SWP water through their respective water supply contracts with the Kern County Water Agency, one of the State Water Project Contractors.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

Pioneer Project Participants receive Kern River water through their respective rights and/or through water service and/or transfer agreements with Kern River water rights holders. These waters are recharged in the Pioneer Project for future recovery and use on lands within Kern County.

3rd Party Programs

Pioneer GSA does not have any 3rd party programs.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Because the Pioneer GSA encompasses the Pioneer Project which is a dedicated banking program, benefit from additional recharge projects and storage projects are not applicable to the Pioneer GSA.

Legal Authority Required

23 CCR § 354.44(b)(7)

The Kern County Water Agency is a special district of the State of CA, that possesses the legal authority to implement P/Mas, on behalf of the Pioneer GSA, discussed herein. Pioneer GSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- Pioneer Participant assessments.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for Pioneer GSA P/MA's by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Pioneer GSA	Estimated Costs	
	One-time	Annual
Implemented	\$320,000	\$50,000
Functional		
In-Process	\$25,000	\$255,000
As-Needed	\$0	\$0
Total	\$345,000	\$305,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, the Pioneer GSA maintains sustainability through balanced pumping and recharge which is included as P/MA. Balanced pumping and recharge utilizes surplus water during wet years, and ensuring deficits do not occur through its continued monitoring and checkbook tracking. Through this combination of the GSAs' P/MA efforts, balanced pumping, recharge, checkbook accounting, and groundwater monitoring, the Pioneer GSA will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Rosedale-Rio Bravo Water Storage District GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as

summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address 25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

(b) Implementation Glide Path – Rosedale Rio-Bravo Water Storage District GSA

☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for RRBWSD GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (0 AFY) of the projected deficit of 0 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example RRB-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either currently being implemented or which have been implemented or in process that contribute to water demand reduction include:

RRB-1 Stockdale East Water Storage and Recovery Project = Includes the acquisition of 200 acres of irrigated land followed and converted to recharge basins, representing a demand reduction benefit of approximately 578 AFY (Net irrigated x ETiw average for 5 years).

RRB-2 Stockdale East Water Storage and Recovery Project = Includes the acquisition of 175 acres of irrigated land followed and converted to recharge basins, representing a demand reduction benefit of approximately 530 AFY (Net irrigated x ETiw average for 5 years).

RRB-3 Kern Fan Water Storage Project Phase 1 = Includes the acquisition of 350 acres of irrigated land followed and converted to recharge basins, representing a demand reduction benefit of approximately 1059 AFY (Net irrigated x ETiw average for 5-years).

RRB-12 White Land Water Budget/Demand Imbalance Reduction = Implementation of a water balance requirement for land within the RRBWSD GSA but not in the Water Storage District whereby their deficit is reduced each year by 5 percent or ultimately 5,200 AFY. White Lands within the RRBWSD GSA that are not used for water banking will correct the water supply imbalance on a linear basis over the planning period of 2020-2040. Like RRBWSD lands, the white lands will start with a native yield of 0.15 AF/acre. The total annual demand for white lands in the RRBMA is about 10,822 AFY with a water supply imbalance (or deficit) of 5,198 AFY. The average agricultural demand is 2.6 AF/acre according to METRIC studies. While agricultural demands in the White Lands range from 1.4-4.9 AF/acre the initial allowable demand will be the average demand of 2.6 AF/acre. It is expected that white lands would seek to acquire water supplies for in-lieu and direct water recharge via banking agreements with RRBWSD or others to offset demands. Demand reduction will occur as follows over the 2020-2040 period; the imbalance will be reduced by 1/20 of the current imbalance each year (5 %) or 0.1 AF/acre.

RRB-13 District Land Water Budget/Water Charge Demand Reduction = Implementation of a tiered groundwater charge for use above sustainable water budget. Conservative estimated agricultural demand reduction of 2.5 percent or 2000 AFY. The

Water Charge would be expected to result in a demand reduction in the Rosedale Rio Bravo Water District (RRBWSD). For market reasons, landowners will probably opt to fallow ground in order to trade water supplies to other District landowners, as well as fallow lands (or limit double cropping) to avoid the Water Charge all together. With an agricultural water consumptive-use demand of about 84,000 AFY, we conservatively expect a 2.5 percent demand reduction as a result of the water charge which results in about 2,000 AFY of reduced demand. This management action could be online as early as 2025. Water Charges could be \$100-250 per AF.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” by 0 AFY by the January 2040 GSP implementation deadline.

GSA-specific Projects either **currently being implemented** or **have been implemented** or **in-process** that contribute to water supply augmentation include:

RRB-1 Stockdale East Water Storage and Recovery Project = Construction of 200 acres of recharge ponds for recharge basins, representing a conservative water supply augmentation of approximately 1103 AFY.

RRB-1 McCaslin Recharge Improvements = Construction of 175 acres of recharge ponds for recharge basins, representing a conservative water supply augmentation of approximately 630 AFY.

RRB-3 Kern Fan Water Storage Project Phase 1 = Construction of 350 acres of recharge ponds for recharge basins, representing a conservative water supply augmentation of approximately 1260 AFY.

RRB-4 Onyx Ranch Water Acquisition = Acquisition of 4109 acres of land associated with water rights from the South Fork of the Kern River. Following of ranches and change of point of diversion to Kern Subbasin for water recharge, representing a conservative water supply augmentation of approximately 6000 AFY.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin

and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

RRB-11 Project Recovery Operations Plan – RRBWSD GSA will continue the deployment of emergency water services to assist domestic well users that experience impacts at a domestic well; the emergency supply service is dispatched within 24 hours of notification of a well issue. Financial assistance for bottled drinking water is also provided if needed. Currently, there are three emergency units available for providing emergency water supplies; each unit can accommodate service to up to 3 household connections and provide non-potable water for in-home use. This number has been sufficient to accommodate all requests to date. Additional units will be acquired as necessary to accommodate requests. This may coordinate or fold into a subbasin wide program. It is expected that as many as 3 of the approximately 149 domestic wells in the RRBMA could require replacement if levels drop to the established Minimum Threshold; similar impacts within the Rio Bravo Community Watch Area could also be experienced. Should that occur and the Joint or Long-term Operations Plans not address the issues per the specified mitigation process, the RRBWSD will establish a similar domestic well mitigation program to repair and/or mitigate impacts.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.

- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by RRBWSD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Several P/MAs have been identified and listed “As Needed” on Table 3 and could reduce the deficit by up to 14,283 AFY if needed.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the RRBWSD GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve

indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (RRB-1, RRB-2, RRB-3, RRB-4, RRB-7, RRB-10, RRB-11, RRB-12, RRB-12, RRB-13) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be delivered from the Friant-Kern Canal through the CVC. RRBWSD is a fourth priority non-CVP SOD Contractor that can take CVP water under certain conditions. The Friant-Kern Canal capacity has been recently hampered by subsidence which has limited available supplies. Remediation efforts are underway and should restore access to these critical supplies by 2030.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor’s place of service for future use. RRBWSD currently receives SWP water through a water supply contract (Table 1 Entitlement 35,000 AF) with Kern County Water Agency (KCWA), one of the State Water Contractors. During

wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use. RRBWSD purchases excess Article 21 water through its State Water Contractor for delivery to existing project recharge facilities using the CVC when such water is available.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

RRBWSD currently receives Kern River water when it is available for water recharge through water service agreements with the City of Bakersfield and other water right holders. Kern River “release” or “flood” water is also available to RRBWSD when water (1) is offered to all takers willing to sign a Notice/Order; or (2) is offered to the Kern River/California Aqueduct Intertie for disposal; or (3) is expected to flood farm acreage; or (4) is expected to be delivered into the Kern River Flood Channel for disposal out-of-county. RRBWSD also takes this released water from the Kern River for water recharge if and when available.

3rd Party Programs

RRBWSD has long operated as 3rd party banking program for several Kern County and outside of Kern County agencies. Over the past several years more interest has been expressed in participating in RRBWSD projects for drought protection needs. Most of these programs are structured on a 2:1 basis, meaning for every acre-foot stored for the 3rd party for later drought supply, RRBWSD receives one for its banking services. These supplies come from the above three identified sources and have provided groundwater supply for RRBWSD and drought protection for the 3rd party.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Water recharge projects have been designed with a very conservative water supply augmentation benefit calculation considering the participation of 3rd parties in future

expansions of its projects based on 2:1 programs. Water supply augmentation benefits have been calculated as follows:

*Annual Water Benefit = estimated infiltration rate ft/day * wetted acres * 150 days operation in a wet year * 20 percent of years being wet * 50 percent of stored water to RRBWSD given a 3rd party banking source.*

This conservative planning method estimates that the total recharge facility opportunity time would be 8 percent of the time. This is less than half of the long-term (2001-2020) of RRBWSD recharge facilities actual of 20 percent utilization.

Potential water supplies that feed water supply acquisition P/MA RRB-4 come from the following source.

The Onyx Ranch project (SCH No. 2018021061) is to change the point of diversion of water available to RRBWSD under its owned Onyx Ranch and Smith Ranch appropriative water rights from the South Fork Valley to the RRBWSD valley floor service area, without injuring other legal users of water. Historically, the water available under these water rights was used for irrigated agriculture in the South Fork Valley. The proposed project involves converting the irrigated fields of the Onyx Ranch and Smith Ranch, which are predominately high consumptive use lower value forage crops, to non-irrigated uses, such as non-irrigated pasture and native vegetation. The amount of water that would have been diverted for the Onyx Ranch and one-third of the Smith Ranch (RRBWSD owned portion) in a given month will then remain in the South Fork Kern River, through Isabella Reservoir, down the lower Kern River to facilities available to RRBWSD. Upon diversion, RRBWSD would comingle the water with its other available surface water supplies for use in its various water management programs to meet existing agricultural and M&I water demands within the RRBWSD service area in Kern County.

The majority of RRBWSD's pre-1914 appropriative rights on the South Fork Kern were quantified in a 1902 Arbitration Decree ("1902 Decree"). The 1902 Decree provides for a specified quantity of diversion, in order of priority, for the named priority rights in the decree, and further, to the extent there is additional flow available above and beyond the demands of the named priority rights, an equal division among the parties named in the decree. RRBWSD's decreed rights are listed in the table as the 1st, 3rd, 6th, 7th, 12th, 30th and 33rd priority rights. The decreed water rights relate to the majority of the Onyx Ranch property acquired by RRBWSD. However, two portions of the Onyx Ranch property were not covered by the 1902 Decree: (1) the Wirth/Lieb fields (160 acres in NW 1/4 of section 13 of T.26S. R.34E; 45.88 acres from Hochman in the NE 1/4 of SW 1/4 of section 13 and NW 1/4 of SE 1/4 of section 14, both in T.26S R.34 E) and (2) the Boone field (160 acres in the SE quarter of Section 7, T.26S. R. 35 E.). (State Statement Number: S021076, S021078, S021079, S021077).

The pre-1914 appropriative rights for the Wirth/Lieb field are documented in the deeds for the property and historic reports describing when the ditch serving the property was constructed in relation to the other ditches along the river. These documents discuss an 1870 ditch, which places the priority of the right between the 11th and 12th in the 1902 Decree.

The Boone field has riparian rights with an 1882 priority date. The riparian rights for the Boone field cannot be transferred. However, water diversions under the Boone riparian right could be reduced to make more water available for appropriative rights junior to 1882, such as the 33rd right under the 1902 Decree.

RRBWSD also acquired a one-third interest in the Smith Ranch (about 690 acres), including its water rights. The Smith Ditch, which serves the Smith Ranch, is one of the oldest water rights on the South Fork Kern, with a priority date of 1861/62.

For all rights the same methodology used in the decree to quantify the rights is for all properties; this method assumes a 150 miner's inch diversion right, under a four-inch pressure, for each 160 acres. This is roughly equivalent to 3 cfs per 160 acres. (State Statement Number: S001456)

Potential water supplies that feed water supply acquisition P/MA RRB-8 and RRB-9 come from the following source.

Both the Sites Reservoir and Delta Conveyance Project rely on pursuing a water right permit and/or amendment from the State Water Resources Control Board (SWRCB), which will provide them legal authority to divert water within certain conditions, for a specific purpose, and use within a specified area. The Sites Reservoir Authority and the Department of Water Resources are responsible for all project water rights permitting.

Legal Authority Required

23 CCR § 354.44(b)(7)

The RRBWSD is a water storage district, that possesses the legal authority to implement P/MAs discussed herein. RRBWSD GSA is also a GSAs, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The

one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for RRBWSD GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

RRBWSD GSA	Estimated Costs	
	One-time	Annual
Implemented	\$9,650,000	\$351,500
Functional		
In-Process	\$46,025,000	\$791,000
As-Needed	\$94,200,000	\$4,319,000
Total	\$149,875,000	\$5,461,500

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. The formation of a groundwater budget program would likely include mechanisms to allow for trading or exchange of pumping allocations within designated areas, subject to constraints dictated by groundwater conditions observed within the Monitoring Network and policies developed by the respective Board of Directors. Through this combination of increased recharge during wet years and demand reduction, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Southern San Joaquin Municipal Utility District GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Table 1. (Glide Path – Target Deficit Reduction)

Project and Management Action Implementation Schedule (AFY)						
Kern County Subbasin Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		2020	2025	2030	2035	2040
Projected Deficit			-372,000

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Southern San Joaquin Municipal Utility District GSA

☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for the Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for SSJMUD GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (8,403 AFY) of the projected deficit of 33,610 AFY during each five-year Milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2035.

Table 2. (Glide Path – Target Deficit Reduction)

Project and Management Action Implementation Schedule (AFY)						
SSJMUD GSA Projected-Future Scenario Deficit Reduction "Glide Path" 354.44 (b)(2)		2020	2025	2030	2035	2040

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example SSJMUD-#) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with "KSB-#" which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin's Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits						Source(s) of Water	Legal Authority Required	Estimated Costs

Projects		Implemented	Functional	In-Process	As-Needed							Implemented	Functional	In-Process	As-Needed								
SSJMUD-1	Exercising Existing Water Rights	The USBR, SLDMWA, FWA, and SJREC have entered into a MOU to collectively identify projects and potential actions aimed at improving drought resiliency South of the Delta, including SSJMUD deliveries from the Friant-Kern Canal (FKC). The South of Delta Drought Resiliency Framework allows participating entities to voluntarily conserve and securely store a portion of their CVP south of Delta deliveries for subsequent use with the goal of providing at least a 5% allocation to CVP south of Delta agricultural water service/repayment contracts, reducing reliance on Delta exports in drought years.	✓			Exercise of Rights	Underway	NA		MOU effective March 2024	2024	2024-	4850	0		✓			Increased reliability of SSJMUD's CVP supplies	Signed MOU	-	-	-

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the estimated “deficit” by 33,610 AFY by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented** or **in process** that contribute to water demand reduction include:

SSJMUD-3, Pandol Spreading Grounds. Acquisition and retirement of 30 acres of irrigated ag lands that will be converted to 30 acres of new recharge ponds. Construction of the ponds was completed in 2017. Demand reduction from taking agricultural lands out of production is 72 AFY.

SSJMUD-4, City of Delano Spreading Grounds. Acquisition and retirement of 40 acres of irrigated ag lands that will be converted to 40 acres of new recharge ponds. Construction of the ponds was completed in 2017. Demand reduction from taking agricultural lands out of production is 14 AFY.

SSJMUD-5, In-District Spreading Grounds. Acquisition and retirement of 32 acres of irrigated ag lands that will be converted to 32 acres of new recharge ponds. Construction of the ponds was completed in 2019. Demand reduction from taking agricultural lands out of production is 11 AFY.

SSJMUD-6, Giumarra Spreading Grounds. Acquisition and retirement of 78 acres of irrigated ag lands that will be converted to 78 acres of new recharge ponds. Construction of the ponds was completed in 2022. Demand reduction from taking agricultural lands out of production is 158 AFY.

SSJMUD-7, Regan Spreading Grounds. Acquisition and retirement of 80 acres of irrigated ag lands that will be converted to 80 acres of new recharge ponds. Construction of the ponds was completed in 2024. Demand reduction from taking agricultural lands out of production is 187 AFY.

SSJMUD-8, Giumarra Additional Spreading Grounds. Acquisition and retirement of 80 acres of irrigated ag lands that will be converted to 80 acres of new recharge ponds. Construction of the ponds was completed in 2025. Demand reduction from taking agricultural lands out of production is 171 AFY.

SSJMUD-9, Urban Land Conversions. Based on General Plans and Urban Water Management Plans, urban sprawl from the cities of Delano and McFarland will cause irrigated agricultural land to be taken out of production and converted to residential and

commercial developments. Demand reduction is calculated based on an average change in ET. The estimated demand reduction is 2,656 AFY.

- City of Delano has identified 2,100 acres to be converted to urban use: estimated demand reduction is 900 AF by 2030 and another 843 AF by 2040.
- City of McFarland has identified 1,100 acres to be converted by 2040; estimated demand reduction is 913 AF by 2040.

SSJMUD-10, Caratan Spreading Grounds. Acquisition and retirement of 160 acres of irrigated ag lands that will be converted to 160 acres of new recharge ponds. Construction of the ponds was completed in 2025. Demand reduction from taking agricultural lands out of production is 315 AFY.

SSJMUD-11, Caratan Additional Spreading Grounds. Acquisition and retirement of 505 acres of irrigated ag lands that will be converted to 505 acres of new recharge ponds. Construction of the ponds was completed in 2026. Demand reduction from taking agricultural lands out of production is 1,078 AFY.

SSJMUD-12, White Land Demand Reduction. SSJMUD offers GSA coverage to 1,083 acres of undistricted lands. Since these lands do not have access to district surface water supplies, a demand management program will be implemented to limit groundwater extraction to the Subbasin's sustainable yield. Assuming an average ET of 3.29 AF/ac, and native yield of 0.15 AF/ac, the overdraft correction is 3,400 AFY.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land's relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin's ability to meet its sustainability goal.

Water Supply Augmentation P/MAs

Water Supply Augmentation P/MAs are the secondary means of implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of 33,610 AFY by the January 2040 GSP implementation deadline.

GSA-specific Projects that are **in-process** as well as those that already **been implemented** or **currently being implemented** that contribute to water supply augmentation include:

SSJMUD-1, Exercise Existing Water Rights. SSJMUD participates in the Friant Water Authority (FWA) Drought Plan MOU between USBR, Exchange Contractors, Friant Contractors and Westside Contractors to work together to bolster dry year supplies. At a minimum, this MOU will provide an additional 5% Class 1 reliability. Friant-wide, the Class 1 total is 800,000 AFY. SSJMUDs allocation is 97,000 AFY, which will yield a minimum of 4,850 AFY increase in supply.

SSJMUD-2, Subbasin Banking Partnerships. Prior to building in-district recharge facilities, SSJMUD partnered with a neighboring water district in a third-party banking program to bank up to 15,000 AFY in existing banking facilities when excess surface water supplies are available. This partnership provides a "leave behind" volume of water to the banking partner and returns previously banked water to SJJMUD when requested. The partnership began in 2018. To date, the current volume available for return is 35,749 AF. SSJMUD’s agreement allows for up to 5,000 AFY to be returned via the Friant-Kern Canal (FKC).

SSJMUD-3, Pandol Spreading Grounds. 30 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 434 AFY.

SSJMUD-4, City of Delano Spreading Grounds. 40 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 578 AFY.

SSJMUD-5, In-District Spreading Grounds. 32 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 462 AFY.

SSJMUD-6, Giumarra Spreading Grounds. 78 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 1,156 AFY.

SSJMUD-7, Regan Spreading Grounds. 80 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 1,084 AFY.

SSJMUD-8, Giumarra Additional Spreading Grounds. 80 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 1,156 AFY.

SSJMUD-10, Caratan Spreading Grounds. 160 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 2,312 AFY.

SSJMUD-11, Caratan Additional Spreading Grounds. 505 acres of recharge ponds constructed in 2017. Based on the method described above, water supply augmentation is estimated at 7,297 AFY.

Data-Gap Filling and Mitigation Efforts

Management Actions either currently being implemented or have been implemented that contribute to water demand reduction include:

KSB-1 Friant-Kern Canal Capacity Mitigation. The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs. The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation. The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks’ worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry. The Subbasin, as part of the 2024 GSP amendment process, developed a more accurate well inventory based on available databases and field verifications. This management action will continue to provide improvements and maintenance of the Subbasin’s existing well inventory and house the well registry within the Kern County Subbasin data management system. At least annually, the Subbasin will update the system using DWR/County well permit information and well surveys. Additional details regarding the data sources and methodologies used to develop the improved well inventory can be found in Section 14.

KSB-8 Consumptive-Use Study. The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V.**

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by SSJMUD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W.** If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new

ones possibly included. The GSA will enact projects and actions to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

SSJMUD-13 was identified and listed "As Needed" on Table 3 and could reduce the deficit by up to 1,219 AFY if needed. **SSJMUD-13, Land Acquisition and Retirement Demand Reduction**. Currently, the Subbasin relies on checkbook accounting based on water supply and use over a period of time (currently 2010 to 2019), which estimates each GSAs deficit. The Basin Study is expected to provide a better understanding for the actual deficit. As groundwater allocation/deficit is better understood, SSJMUD will continue to refine PMAs. If additional demand reduction is needed, a land acquisition and retirement program will be implemented. Currently, the remaining deficit to be addressed in 2030 is 1,219 AFY.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary "Glide Path" has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the "Glide Path" Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented. In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional. In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process. Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As Needed. As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MAs,

new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown on Table 14-2, the SSJMUD GSA has a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve

indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

P/MAs that are in-progress as well as those that already been implemented that contribute to water demand reduction include assumptions as follows:

- Converting irrigated land to recharge basins, representing a demand reduction benefit estimated based on ITRC-METRIC results. Average ET from 1993 to first year of operations minus average ET of precipitation from bare ground (estimated as 80% of average precipitation 7.29 inches (1993-2022)). Demand reduction for lands converted from irrigated agriculture to recharge basins ranges from 0.73 AF/ac (fallow land) to 2.47 AF/ac. The average of the irrigated acres is 1.88 AF/ac.
- Converting irrigated land to urban use. Consistent with UWMP prepared by the cities of Delano and McFarland, water demand will be reduced through land conversions from irrigated agriculture to residential or commercial use. The estimated demand reduction rate is 0.83 AF/ac. Acres estimated to be converted in each 5-year period is consistent with SSJMUD’s glidepath of 25% each 5-year period.
- Exercising existing water rights and calling for return of previously banked water. These programs and their expected benefits are described in the project summaries below.
- SSJMUD primarily intends to use its existing water rights and conjunctive use program to limit groundwater pumping to sustainable yield. Average annual water supply augmentation through constructing spreading grounds was estimated individually based on historic water availability adjusted to 4 out of 10 years for completed basins and based on assumed water available in 4 of 10 years, 0.5 feet per day of recharge for an average of 85 days per year in the years when water is available. Water supply is Central Valley Project Class 1 (97,000 AF),

Class 2 (45,000 AF), and maximizing access to Unreleased Restoration Flows (URF) and all other available CVP supplies.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (SSJMUD-1 through SSJMUD-8, SSJMUD-10, and SSJMUD-11) will come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. As a result, SSJMUD has access to Class 1 water (97,000 AF contract), Class 2 water (45,000 AF contract), and several other types of water through its contract (Unreleased Restoration Flows, Recaptured/Recirculated supplies, Section 215 water, and RWA water). With in-district spreading grounds and its third-party banking program, SSJMUD will be able to fully utilize all flows available through its contract, whereas historically it has been limited to what its growers would use in a given year.

Legal Authority Required

23 CCR § 354.44(b)(7)

SSJMUD is a municipal utility district, that possesses the legal authority to implement P/MAs discussed herein. SSJMUD GSA is also a GSAs, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for SSJMUD GSA P/MAs by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Southern San Joaquin Municipal Utility GSA	Estimated Costs	
	One-time	Annual
Implemented	\$5,160,000	\$245,470
Functional	\$3,410,000	\$13,175
In-Process	\$14,655,000	\$161,525
As-Needed	\$13,475,000	\$116,500
Total	\$36,700,000	\$536,670

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. Through this combination of increased recharge during wet years and demand reduction, the GSAs’ P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Shafter Wasco Irrigation District GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 1. (Glide Path – P/MA Planned Deficit Reduction vs. Milestones)

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Shafter Wasco Irrigation District GSA

☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal.

For the purpose of this section, SWID GSAs P/MA implementation schedule is separated into two sections: SWID GSA without the 7th Standard Annex, and the 7th Standard Annex. When SGMA was passed, SWID annexed in roughly 10,000 acres of un-districted white lands located directly to its South. The water supplies of SWID are not shared with the 7th Standard Annex – the purpose of the annexation was to provide SGMA coverage, and to provide a vehicle to collect funds from 7th Standard Annex landowners with the intent to use those funds to develop and adopt a GSP and implement P/MA's necessary to reach sustainability. Thus, there is a separate list of P/MAs for the SWID GSA without 7th Standard Annex, and the 7th Standard Annex. For the purposes of this section, SWID GSA without 7th Standard Annex will be referred to as “SWID”, and the 7th Standard Annex will be referred to as “7th Standard Annex”.

While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for SWID and 7th Standard Annex in Table 2 and Table 3 below and illustrated on Figure 3 and Figure 4. Table 2 and Figure 3 illustrate expected conditions for the SWID GSA without the 7th Standard Annex and Table 3 and Figure 4 show conditions for the 7th Standard Annex.

These “Glide Paths” are aimed to address 25 percent of the GSA’s projected deficit during each five-year Milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA.

SWID has a minimum P/MA target of 22,560 AFY and the SWID P/MAs presented below have been developed to address this deficit in the five-year milestone periods referenced above. The SWID target deficit reduction in each five-year period is 5,640 AFY. Because the SWID began developing P/MAs in 2015 shortly after SGMA was passed, the anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction for SWID as early as 2025.

The 7th Standard Annex has a projected deficit of 12,260 AFY. The P/MA implementation schedule for the 7th Standard Annex has been developed to mitigate 25 percent (3,065 AFY) of the projected deficit for this area during each five-year milestone period, thereby eliminating the deficit by 2040.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example SWID-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

This page intentionally left blank.

Table 4. (GSA P/MAs)

☑ 23 CCR § 354.44(b)(1)

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 34,820 AFY (combined) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline described above.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented or in-process** that contribute to water demand reduction include:

Shafter-Wasco Irrigation District

SWID-1 Kimberlina Recharge Project = Conversion of 280 acres of farmland to recharge basins. This was a demand reduction of 998 AFY that has already been implemented.

SWID-2 Bell Recharge Project and Pump Station = Conversion of 35 acres of farmland to recharge basins, and a pipeline modification to maximize water deliveries to the project. This was a demand reduction of 123 AFY that has already been implemented.

SWID-3 Farmers Coop and Pipeline = Conversion of 25 acres of farmland to recharge basins, and a pipeline modification to maximize water deliveries to the project. This was a demand reduction of 88 AFY that has already been implemented.

SWID-6 Southeast Recharge = Conversion of 35 acres of farmland to recharge basins. This was a demand reduction of 123 AFY that has already been implemented.

SWID-7 Dresser Recharge = Conversion of 112 acres of farmland to recharge basins. This is a demand reduction of 392 AFY that is currently being implemented in 2024.

SWID-8 Poplar Recharge = Conversion of 77 acres of farmland to recharge basins. This was a demand reduction of 270 AFY that took place in 2023.

SWID-9 Jack Recharge = Conversion of 118 acres of farmland to recharge basins. This is a demand reduction of 413 AFY that will take place in 2025.

SWID-17 Ag to Urban Conversion = As the cities expand, they will retire agricultural land and it'll be converted to urban land, with a substantially lower demand for water (projected 2,600 AFY by 2040).

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were

absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in Appendix D. Due to the white land's relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin's ability to meet its sustainability goal.

7th Standard Annex

7th Standard Annex-2 ET Limitations/Water Budget = 7th Standard Annex has done rotational fallowing since 2020, and in 2025 will begin implementing a Water Budget that ramps down allowable ET from 3 AF/Acre to 0.57 AF/Acre by 2040, or a higher number if 7th Standard Annex is successful in purchasing supplies for recharge. If all other projects are unsuccessful in 7th Standard Annex, this P/MA alone will be sufficient to lead to sustainability.

Water Supply Augmentation P/MA's

Water Supply Augmentation P/MAs are the secondary means of implementation of a "Glide Path" that will result in closing the balance of the currently identified "deficit" of 34,820 AFY (combined) under the 2030 Climate Change Scenario described above by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented or in-process** that contribute to water demand reduction include:

Shafter-Wasco Irrigation District

SWID-1 Kimberlina Recharge Project = Conversion of 280 acres of farmland to recharge basins. This will allow SWID to capture 6,000 AFY more water available through its contract. This project came online in 2016.

SWID-2 Bell Recharge Project and Pump Station = Conversion of 35 acres of farmland to recharge basins, and a pipeline modification to maximize water deliveries to the project. This will allow SWID to capture 1,000 AFY more water available through its contract. This project came online in 2019.

SWID-3 Farmers Coop and Pipeline = Conversion of 25 acres of farmland to recharge basins, and a pipeline modification to maximize water deliveries to the project. This will allow SWID to capture 530 AFY more water available through its contract. This project came online in 2020.

SWID-4 Grower Recharge and Subsurface Recharge Program = Implementation of policy that encourages landowners to install subsurface recharge systems and/or recharge water on fallowed acreage during wet years. This will allow SWID to capture more water available through its contract. This project came online in 2017.

SWID-6 Southeast Recharge = Conversion of 35 acres of farmland to recharge basins. This will allow SWID to capture 700 AFY more water available through its contract. This project will come online in 2024.

SWID-7 Dresser Recharge = Conversion of 112 acres of farmland to recharge basins. This will allow SWID to capture 2,400 AFY more water available through its contract. This project will come online in 2025.

SWID-8 Poplar Recharge = Conversion of 77 acres of farmland to recharge basins. This will allow SWID to capture 1,750 AFY more water available through its contract. This project will come online in 2025.

SWID-9 Jack Recharge = Conversion of 118 acres of farmland to recharge basins. This will allow SWID to capture 2,655 AFY more water available through its contract. This project will come online in 2026.

SWID-12 2:1 Recharge Programs = SWID has signed four 2:1 programs, where partners import 2 AF and SWID returns to them 1 AF at a future year. This will be a water supply benefit for SWID of an estimated 3,000 AFY. These agreements were executed in 2023.

SWID-13 2:1 SLR Program = SWID has historically had access to roughly 1250 AFY in San Luis Reservoir as a result of the SJRRP Restoration Program and more specifically the water management goal. SWID has agreements to begin to double that water through 2:1 exchange programs, and import it into the District. This will be a water supply benefit for SWID. These agreements were executed in 2022.

SWID-14 Water Quality Mitigation = The recently signed Water Quality Guidelines of the Friant Kern Canal will give SWIID additional water annually for Reclamation Leaching based on the water quality throughout the year. This will be a water supply benefit for SWID of an estimated 500 AFY and will likely grow in the future as pump-ins increase during drought cycles.

SWID-16 FWA Drought Plan MOU = Execution of a Drought Plan that will reduce the number of "Call on Friant", which have historically decreased the Class 1 Friant Allocation in dry years. Under this Drought Plan MOU, USBR, Exchange Contractors, Friant Contractors and Westside Contractors will work together to bolster dry year supplies.

7th Standard Annex

7th Standard Annex-1 Purchase Supplemental Water Supplies = 7th Standard Annex collects assessments and will use them to purchase water supplies during wet years for recharge in adjacent Districts, most often in SWID. As these supplies accumulate, they will increase the quantity that can be sustainably pumped in 7th Standard Annex.

Operational Improvement, Data-Gap Filling, and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

Shafter-Wasco Irrigation District

SWID-5 Diltz/Leonard Interties with SWSD = Installation of two interties to allow for 2-way movement of water to and from SWSD, to enable both Districts to fully maximize wet year supplies when available.

SWID-10 Southern Calloway Turnout = Installation of a turnout to enable the SWID southern FKC turnout to deliver water to the Calloway, which will feed Poplar, Dresser, Bell, and Jack Recharge. This will enable SWID to maximize the use of those facilities.

SWID-11 Improved Water Level Measurement = Installation of a monitoring well at the Kimberlina Recharge facility to ensure that banking operations do not contribute to localized impacts.

SWID-15 Well Mitigation Policy = SWID will adopt a well mitigation policy that is consistent with basin-wide efforts to mitigate effects from lowering groundwater levels.

SWID-18 WQ Trend Study/Program Coordination = Filling data gap on water quality, and the impact of groundwater management activities on the groundwater quality. Also coordinating with WQ Programs (CVSALTS, etc.) if and when impacts occur.

7th Standard Annex

7th Standard Annex-3 Well Mitigation Policy = SWID will adopt a well mitigation policy that is consistent with basin-wide efforts to mitigate effects from lowering groundwater levels.

7th Standard Annex-4 WQ Trend Study/Program Coordination = Filling data gap on water quality, and the impact of groundwater management activities on the groundwater quality. Also coordinating with WQ Programs (CVSALTS, etc) if and when impacts occur.

Subbasin-Wide

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see Appendix U). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.

- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in Appendix V.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by SWID GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact PMA’s to accomplish at least a linear path to sustainability. A management action to impose evapotranspiration limits on water users in the SWID GSA has been identified and listed **“As Needed”** on Table 4 to provide further water demand reduction in the future, if needed. The 7th Standard Annex already has a landowner-level demand reduction program that is in place; however, SWID does not currently have a landowner-level demand reduction plan, since it appears that through its P/MAs it will reach sustainability well ahead of the 2040 deadline. If for any reason, SWID’s planned demand reduction and supply augmentation projects are unsuccessful, and in the year 2033 SWID still has a historical 10-year average deficit, SWID will implement SWID-19 P/MA which is landowner-level ET allocations, pumping restrictions, and encourage land fallowing to reduce demand and reach sustainability.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 4 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

☑ 23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown on Table 14-2, the SWID GSA has net water budget deficits in both the primary SWID area and the 7th Standard Annex over the historical period based on the specific budget model (approximately 22,560 AFY for SWID excluding the 7th Standard Annex, and 12,260 AFY in the 7th Standard Annex). The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

☑ 23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, Caltrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 4. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2 and Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit will be quantified directly through flow measurement. For P/MAs that involve indirect supply augmentation through increased groundwater storage or banking, quantification of the benefit will require tracking of project water deliveries and estimates of indirect supply increases based on specific project conditions. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against the recent historical and projected condition without the P/MA in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies for water supply augmentation P/MAs (SWID-1, SWID-2, SWID-3, SWID-4, SWID-6, SWID-7, SWID-8, SWID-9, SWID-12, SWID-13, SWID-14, and SWID-16) could come from the following sources:

Central Valley Project

SWID (excluding the 7th Standard Annex Area) is a Friant Contractor, and thusly receives water through the Central Valley Project (CVP), which is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. As a result, SWID has access to Class 1 water (50,000 AF contract), Class 2 water (39,600 AF contract), and several other types of water through its contract (Unreleased Restoration Flows, Recaptured/Recirculated supplies, Section 215 water, and RWA water). In addition to this, SWID's recharge facilities are located off the Calloway Canal, which connects to the Cross Valley Canal, which means that SWID is able to receive water from the California Aqueduct, Cross Valley Canal, Friant Kern Canal, and the Kern River system, if SWID is able to execute purchases or exchanges for the water supplies it doesn't have access to through its contract. With its additional recharge, SWID will be able to fully utilize all flows available to it through its contract, whereas historically it has been limited to what its growers would use in a given year. The 7th Standard Annex has no surface water supply, and does not share in SWID's surface water supplies.

Exchange Agreements

SWID has a history of participating in exchange agreements with parties within and outside the Subbasin. Over the last several years, there has been increased interest and SWID has executed five 2:1 exchange agreements which provide additional water supply for P/MAs and localized water supply benefits.

Legal Authority Required

23 CCR § 354.44(b)(7)

The SWID is an irrigation district that possesses the legal authority to implement P/MAs discussed herein. SWID GSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 4, and include the following:

- Property assessments and/or SWID water charges.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and SJRRP.

Estimated costs for P/MAs by implementation status for SWID and for the 7th Standard Annex alone are summarized in Table 5 and Table 6, respectively. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 5. (P/MA Cost by Implementation Status, SWID GSA excluding 7th Standard Annex)

Shafter-Wasco Irrigation District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$18,725,000	\$120,000
Functional		
In-Process	\$22,530,000	\$260,000
As-Needed		
Total	\$41,255,000	\$380,000

Table 6. (P/MA Cost by Implementation Status, 7th Standard Annex)

7th Standard SWID	Estimated Costs	
	One-time	Annual
Implemented	\$0	\$50,000
Functional		
In-Process	\$25,000	\$105,000
As-Needed		
Total	\$25,000	\$155,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. Through this combination of increased recharge during wet years and demand reduction, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

This page intentionally left blank.

Semitropic Water Storage District GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- 23 CCR § 354.44(a)
- 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage "deficit" of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as

summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address 25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 1. (Glide Path – P/MA Planned Deficit Reduction vs. Milestones)

Figure 2.(P/MA by Category)

(b) Implementation Glide Path – Semitropic Water Storage District GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for SWSD GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (34,010 AFY) of the projected deficit of 136,040 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2033.

Figure 3. P/MA-5 (Glide Path – P/MA Planned Deficit Reduction vs. Milestones)

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example SWSD-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MA)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits							Source(s) of Water	Legal Authority Required	Estimated Costs

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 136,040 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs that **have either been implemented** or **are currently being implemented or in-process** and contribute to water demand reduction include:

SWSD-16 Landowner Water Budgets – The SWSD GSP includes SWSD-16 Landowner Water Budgets as the principal Management Action to achieve sustainability. SWSD-16 Landowner Water Budgets established individual water budgets for landowners by landowner classes to reduce SWSD’s demand to available surface water considering effective precipitation and the Native Yield which is currently assumed to be 0.15 acre-feet per acre. The Program consists of surface water and groundwater supplies of the SWSD allocated to each unique parcel according to their Land Class and/or the SWSD’s Project as funded by the General Project Service Charge (GPSC) and special GPSC. The Program includes a Temporary Consumptive-Use Allowance (TCA) for each parcel consisting of a temporary water supply allocation to meet the consumptive use of irrigated crops or managed habitats. The TCA will be incrementally reduced each year until 2040, when the TCA will be zero for all parcels such that the aggregate consumptive use of the remaining irrigated crops and management habitat will equal the sustainable water supply of the SWSD.

Beginning in 2022, SWSD allocated the total water supply of SWSD to each landowner based on their land class and level of contractual agreement with SWSD for either SWP supplies or the GPSC to meet the consumptive use or crop evapotranspiration of their properties. All parcels or portions of parcels within the SWSD GSA can be categorized into four categories depending on their level of contractual participation in the SWSD water supply programs and land use practices. The water budgets developed for each landowner define the required reduction in consumptive water demand and associated groundwater extractions necessary to balance SWSD’s total water budget and eliminate local overdraft within the boundaries of the SWSD GSA. Landowner Water Budgets were delivered to all landowners in 2021 and became effective in 2022. While water budgets, per SWSD-16, became effective in 2022, SWSD has been working with landowners since 2015.

SWSD-17 Tiered Pricing for Groundwater Pumping – SWSD GSA is developing the tier pricing structure identified as Management Action SWSD-17 Tiered Pricing for Groundwater Pumping to incentivize groundwater users to manage their respective water demand as provided in the SWSD-16 Landowner Water Budgets. SWSD-17 reinforces the adherence to SWSD-16 Landowner Water Budgets and provides funding

for other projects and management actions, including a Domestic Well Mitigation Program (Management Action KSB-5). The tiered pricing structure creates a rate structure such that if a landowner's consumptive use (Et) includes the use of their TCA or exceeds their annual Total Consumptive Use Water Budget, as provided in the SWSD-16 Landowner Water Budgets, then fees would be charged to incentivize adherence to the water budgets and such fees would be used by the SWSD GSA to mitigate potential impacts to domestic wells in the GSA and to fund project and management actions including the acquisition of supplemental water supplies.

This tiered water rate structure has been developed in coordination with the Tiered Water Rate Structure technical memorandum developed by GEI Consultants (April 2022) with the support of M.Cubed, an economic consultant retained to develop recommendations for proposed tiered rates. This tiered structure allocates the tiered rates developed by M.Cubed relative to the magnitude of a water budget exceedance in relation to a landowner's Total Consumptive Use Budget for the calendar year.

However, it is the intent of the SWSD GSA to work with its landowners to continue to develop new and enhanced supplemental water supply projects, and to the extent possible, maintain as many irrigated acres within the SWSD GSA as economically viable. As needed, the SWSD GSA will initiate environmental and regulatory compliance efforts for other projects and management actions that enhance SWSD's supplemental water supplies.

The implementation of SWSD 16 and 17 are the primary management actions undertaken by the SWSD GSA to achieve sustainability.

Water Supply Augmentation P/MA's

Water Supply Augmentation P/MAs are the secondary means of implementation of a "Glide Path" that will result in closing the balance of the currently identified "deficit" of 136,040 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs that **have either been implemented** or **are currently being implemented or in-process** and contribute to water demand reduction include:

SWSD-5 Water Market Acquisitions – Increased participation in state-wide water markets for spot market and long-term water transfers and maximize acquisition of wet year water supplies for recharge.

SWSD-11 Tulare Lake Project – Development of conveyance facilities to divert Kings River flood flows for direct use and recharge in the SWSD.

SWSD-12 Enhanced Groundwater Recharge – Development of surface water and subsurface water recharge projects underlying developed agricultural lands to increase groundwater recharge capacity.

Additionally, the SWSD GSA is implementing the following projects to improve operational efficiencies and water management flexibility.

SWSD-2 Leonard Avenue System – Conveyance capacity to support delivery of surface water for groundwater recharge. Interconnection with Shafter-Wasco Irrigation District.

SWSD-3 Diltz Intertie – Conveyance to support delivery of surface water for groundwater recharge. Interconnection with Shafter-Wasco Irrigation District.

SWSD-4 Cox Canal Pump Station – Conveyance capacity to support delivery of surface water for groundwater recharge. Interconnection with Buena Vista Water Storage District.

SWSD-6 Stored Water Recovery Unity-XYZ – Development of water storage to expand in-lieu service areas.

SWSD-7 Pond-Poso Spreading Grounds, Phase II – Development of spreading facilities to increase groundwater recharge capacity.

SWSD-8 Shuster Spreading Grounds – Development of spreading facilities to increase groundwater recharge capacity.

SWSD-9 Poso Creek Flood MAR – Development of floodwater capture and recharge program from Poso Creek flood flows.

SWSD-10 Pond-Poso Entrance Ponds – Development of floodwater capture and recharge program from Poso Creek flood flows.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in Appendix T. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains,

siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA's position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

SWSD-1 Monitoring Network Improvement Plan – Assess and identify monitoring network requirements for full compliance with SGMA and development of an implementation plan for achieving full compliance. Additional wells leverage existing network of monitoring wells.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction

fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by SWSD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The SWSD GSA will enact projects and actions to accomplish at least a linear path to sustainability. Several PM/As have been identified and listed “As Needed” on Table 4 and could reduce the deficit by up to 1,800 AFY or more if needed as summarized below.

SWSD-12 Evaluation and Assessment of GDEs within the Semitropic Area – Conduct additional analysis to verify the presence and extent of GDEs in the Semitropic area and, if present, develop appropriate monitoring protocols.

SWSD-14 Brackish Water Desalination – Development of a brackish water treatment facility to treat locally sourced brackish water for SWSD use.

SWSD-15 In-District Water Markets and Transfers – SWSD will allow for the development of market for in-district transfers.

SWSD-18 District Following Program – The intent of SWSD-18 District Following Program is to support the following of up to 39,000 acres over the 20-year SGMA implementation period. The SWSD GSA land following program supports land following as an SWSD GSA action, and action by an individual landowner, groups of landowners, or a combination thereof. An objective of the program is a reduction in consumptive use required to reduce or eliminate SWSD GSA’s estimated water budget deficit of approximately 136,040 AFY. If achieved through land following alone, this would result in the following of between 32,650 and 44,250 acres of irrigated lands, if no additional water supplies can be developed to offset this deficit. The range of potentially fallowed lands is based on a range of per acre consumptive use (measured as crop evapotranspiration (Et)) of 3.8 to 2.8 acre-feet per acre of currently irrigated lands.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting processes that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

☑ 23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2, the SWSD GSA does have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

☑ 23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.

- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (SWSD-2, SWSD-3, SWSD-4, SWSD-5, SWSD-6, SWSD-7, SWSD-8, SWSD-9, SWSD-10, SWSD-11, SWSD-15) could come from the following sources:

State Water Project

The primary source of imported water to SWSD is supplied by the State Water Project (SWP), which is conveyed through the California Aqueduct, transporting water from the Sacramento-San Joaquin Delta along the west side of the San Joaquin Valley to Kern County. Semitropic holds a contract with the Kern County Water Agency (KCWA) for a share of the imported water conveyed by the SWP. Due to recent regulatory and judicial decisions, hydrologic conditions, and reservoir storage, the SWP is not able to deliver full amounts of the 95,200 AFY of Table A contracted water in most years. Additionally, during hydrologically wet years, DWR may declare Article 21 water available, allowing for the diversion of uncontrolled water that cannot be stored in State reservoirs. SWSD purchases Article 21 water through its state water contract and recharges it in existing recharge facilities for later use during drought or dry years when surface water is scarce.

Supplemental SWSD Supplies

In addition to SWP water, SWSD is also within the Federal place of use and is eligible to receive waters from the Federal projects. SWSD occasionally receives Section 215 floodwater from the Central Valley Project (CVP). Furthermore, SWSD may also receive Kern River water via interconnections with adjoining districts and by way of its participation in the Pioneer and Kern Water Bank projects located within the Kern Fan. Other sources of supplemental SWSD supplies include dry year transfers, other water purchases, and leave behind from third party banking operations in which SWSD banks water in their recharge facilities on behalf of its neighbors for a leave behind credit.

Poso Creek

Poso Creek is the main natural surface water body flowing into SWSD, which originates in the Sierra Nevada and only provides surface water in very wet years. West of Central Avenue, Poso Creek Flood Channel was built to control flood events. Diversions off Poso Creek are governed by an agreement between North Kern Water Storage District, Cawelo Water District, and Semitropic, who share flood flow runoff from the creek. Under the agreement, riparian users have first right to the water. Once these are satisfied, the water is shared among the three agencies in accordance with the established guidelines based on flow measured in Poso Creek at Highway 65. SWSD may divert floodwater for flows between 300 cfs and 685 cfs.

Kings River

The Tulare Lake Project aims to contribute to the long-term, reliably water supply for SWSD and its landowners. The proposed project would capture floodwater from the

South Fork of the Kings River and possibly other Tulare Lake tributaries and deliver captured surface water to SWSD and other places of use. Project water may be stored in the SWSD's groundwater banking facilities or other banking facilities outside of SWSD that are accessible by the California Aqueduct and/or other water conveyance facilities accessible by SWSD. Water captured and stored by the project would be pumped by SWSD landowners or transferred by direct delivery or exchange for use on existing irrigated lands. The proposed project assumes the diversion of 1,200 cfs of Kings River floodwaters at Empire Weir No. 2 into the South Fork Canal and Blakeley Canal, conveyance of 100 cfs via the Blakeley Canal into storage in the Kettleman Reservoir, conveyance of 1,200 cfs of water via the South Fork Canal and proposed Kettleman Canal to the Aqueduct, and an Aqueduct Intertie facility and ancillary project facilities, including an electrical switchyard and substation and a maintenance yard. SWSD is currently waiting on determination of water rights for project implementation. If approved, the proposed project is estimated to provide 35,000 AFY.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

For the SWSD GSA, most of the groundwater banking recharge and storage projects do not provide a direct supply augmentation benefit but instead provide the means to realize benefits of water market acquisitions and purchases.

Legal Authority Required

23 CCR § 354.44(b)(7)

The SWSD is a water storage district, that possesses the legal authority to implement P/MAs discussed herein. SWSD GSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges.
- Grant funding from sources including DWR and United States Bureau of Reclamation (USBR).

Estimated costs for SWSD GSA P/MA's by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include "one-time" costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Semitropic Water Storage District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$22,910,000	\$9,800,000
Functional		
In-Process	\$346,025,000	\$1,145,000
As-Needed	\$50,000	\$925,000
Total	\$368,985,000	\$11,870,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, in particular during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available once demands increase. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects, the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. Through this combination of increased recharge during wet years and demand reduction, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Tejon-Castac Water District GSA

Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time,

general implementation schedules, also known as a glide path, have been developed as summarized in Table 1. (Glide Path – Target Deficit Reduction) and illustrated on Figure 1. This glide path is aimed to address 25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. (Glide Path – Target Deficit Reduction). The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

(b) Implementation Glide Path – Tejon-Castac Water District GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for Tejon-Castac Water District (TCWD) GSA Table 2 below and illustrated on Figure 3. TCWD GSA is not currently in a deficit and therefore no target deficit reduction is planned through 2040; however, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example TC-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Primary (AFY)						Source(s) of Water	Legal Authority Required	Estimated Costs

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

Subbasin-wide P/MAs either that contribute to water demand reduction include:

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” by 0 AFY by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** **or have been implemented** that contribute to water supply augmentation include:

TC-1 Recharge of Carrot Wash Water = Tejon Ranch Company (TRC) recharges carrot wash water generated at a nearby carrot processing facility to a 75.5-acre parcel located just outside of the Tejon-Castac Management Area (Township 32S Range 30E Section 6). This project is anticipated to continue in the future, and results in a local recharge benefit of 300 AFY. A production well may be installed in the future at the site to allow for recovery of recharged groundwater.

TC-2 Conversion of Granite Quarry to Sycamore Ranch = The Granite Co. quarry, located upstream of the Sycamore Spreading Basins, is approaching the end of its operational life and could be converted into a balancing / detention / spreading reservoir. Excess flows in the North Canal could be pumped into the quarry reservoir, so the detained water could be recirculated for irrigation demands in-lieu of groundwater pumping and/or recharged. Estimated benefit from this project is 3,000 – 6,000 AFY in wet years, or 1,500 AFY on average when considering non-wet years.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established

SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (**see Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (**see Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for

running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.

- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by TCWD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA’s, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects’ infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting processes that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the TCWD GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.

- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 1. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve indirect supply augmentation through, for example, increased groundwater storage, quantification of the benefit will require tracking of deliveries to said projects against the estimated case. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (TC-1 and TC-2) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. TCWD would contract with AEWS D to receive excess flows in the North Canal. AEWS D has a contract with the United States Bureau of Reclamation (USBR) for 40,000 acre-feet per year (AFY) of Class 1 water and 311,675 AFY of Class 2 water from the Friant Division of the Central Valley Project (CVP). AEWS D also has access to water from the following associated sources: Recovered Water Account (RWA), Unreleased Restoration Flows (URF), Recapture & Recirculation (R/R), and Section 215 water.

Industrial Process Water

TC-1 utilizes industrial process water from a carrot washing facility.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Water banking recharge projects have been designed assuming a wet year occurs every 2.5 years, with a maximum benefit over 100 days. Water supply augmentation benefits have been calculated as follows:

*Annual Water Benefit = estimated infiltration rate ft/day * wetted acres * 100 days operation per year * 40 percent of years being wet*

P/MAs (TC-1 and TC-2) will be met with AEWS D contract water or industrial process water.

Legal Authority Required

23 CCR § 354.44(b)(7)

The TCWD is a water district, that possesses the legal authority to implement P/MAs discussed herein. As GSAs, per California Water Code (CWC) § 10725 through 10726.8, the TCWD GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

☑ 23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- TCWD general funds, generally supported and subsidized by landowner fees;
- Partnering agencies or entities or certain P/MAs (e.g., AEWSD, carrot processing facility); and/or
- Grant funding from sources including DWR and others.

Estimated costs for TCWD GSA P/MAs by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Tejon-Castac Water District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$4,500	\$50,000
Functional		
In-Process	\$15,025,000	\$105,000
As-Needed		
Total	\$15,029,500	\$155,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that augment supplies from additional outside sources of water, particularly during normal to wet years. Some of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes participating in Subbasin-wide policy-based management actions aimed at demand reduction and mitigation. Through this combination of increased recharge during wet years, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Westside District Water Authority GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as

summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address 25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 2. (P/MA by Category)

(b) Implementation Glide Path – Westside District Water Authority GSA (WDWA)

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for WDWA GSA Table 1 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (0 AFY) of the projected deficit of 0 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example RRB-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits						Source(s) of Water	Legal Authority Required	Estimated Costs		
			Groundwater Levels & Storage	Groundwater Quality	Land Subsidence								Primary (AFY)		Secondary						One-time Costs	Ongoing Costs (per year)	Potential Funding Source(s)
													Water Supply Augmentation	Demand Reduction	Water Quality Improvement	Flood Control	Water Management Flexibility or Efficiency	Mitigation Programs

WDWA-8	As-Needed Land Following	Since 2015, WDWA GSA landowners have fallowed over 13,000 acres of permanent crops. Due to naturally high salinity levels, WDWA GSA's groundwater cannot be used for agricultural beneficial use without blending or other prohibitively expensive treatment. Thus, WDWA GSA landowners are 98% reliant on imported surface water supplies (on average between 2015 to 2023) to meet irrigation demand. In dry years where irrigation demand exceeds the Table A allocation provided by the SWP, WDWA GSA landowners utilize their robust supplemental surface water purchase and storage program (P/MA WDWA-1) rather than increase groundwater pumping and risk permanent crop damage or death due to salt stress.	✓			Demand Reduction	Complete	NA	NA	As Needed	Ongoing	As-Needed	0	39,000 cumulative since 2015					NA	None	Landowner asset losses of more than \$400,000,000 in market value	N/A	None required, landowners absorb revenue losses	

This page intentionally left blank.

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified the WDWA GSA “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA specific P/MAs either **currently being implemented** or which **have been implemented** or **in-process**, that contribute to water demand reduction include “voluntary” land fallowing.

WDWA-8 As-Needed Land Fallowing: WDWA GSA has no further demand reduction projected under the 2030 Climate Change Scenario thus no additional demand reduction P/MAs are planned for implementation. However, WDWA GSA has identified “voluntary” land fallowing as an “as-needed” P/MA. Since 2015, WDWA GSA landowners have fallowed over 13,000 acres of permanent crops. Due to naturally high salinity (TDS) levels, WDWA GSA's groundwater cannot be used for agricultural beneficial use without blending or other prohibitively expensive treatment. On average, between 2015 to 2023, WDWA GSA landowners were 98% reliant on imported surface water supplies, primarily supplied by the State Water Project (SWP), to meet irrigation demand. WDWA GSA JPA member districts (Belridge Water Storage District [BWSD], Berrenda Mesa Water District [BMWD], and Lost Hills Water District [LHWD]) collectively hold 333,218 AFY of SWP Table A entitlement via the Kern County Water Agency. In dry years where irrigation demand exceeds the SWP Table A allocation, WDWA GSA landowners first utilize their robust supplemental surface water purchase and storage program (PMA WDWA-1) to supplement water supplies. Due to high salt levels, landowners cannot use groundwater to compensate for inadequate surface water supplies without risking permanent crop damage/death. If PMA WDWA-1 fails to provide sufficient supplemental surface water supplies, landowners are forced to either deficit irrigate (reducing crop yields) or selectively fallow acreage to conserve available surface water supplies.

Historically, WDWA GSA landowners have “voluntarily” fallowed acreage if irrigation demand exceeds surface water supply. While WDWA GSA does not mandate land fallowing in dry years, economic viability of surface water costs and impacts to crop health due to poor groundwater quality act as natural enforcement mechanisms against groundwater overdraft. Landowners are empowered to make strategic fallowing decisions via WDWA GSA’s member districts’ use of Latis Water District Management Software. Latis tracks available surface water supplies versus delivered surface water volumes on a weekly time step at the landowner level. Landowners use these data to determine if they have sufficient surface water supplies for their acreage and make

voluntary following decisions to re-direct available supplies to the remainder of their planted acreage.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in **Appendix D**. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of implementation of a “Glide Path” That will result in maintaining WDWA GSA “deficit” by 0 AFY (i.e., a surplus) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA specific Projects either **currently being implemented** or **previously implemented** or **in-process** that contribute to water supply augmentation include:

WDWA-1 Long Term Supplemental Water Programs: Even prior to the passage of SGMA, WDWA GSA landowners could not rely upon groundwater supplies to weather surface water supply shortages due to poor groundwater quality. Therefore, WDWA GSA JPA member districts made, and continue to make, significant investments in supplemental surface water acquisition and banking programs to diversify their water supply portfolio. WDWA GSA, via its JPA member districts, has successfully purchased over 1.6 million AF from State Water Contractors (SWCs), Central Valley Contractors, pre-1914 water rights holders, and the SWP Dry-Year program since 2015. Several WDWA GSA landowners also have independent supplemental surface water acquisition programs; however, to be conservative in calculating available supplemental supplies, the volumes acquired from these independent landowner programs are not included in this P/MA WDWA-1. Several of these purchases are long-term agreements valid through 2030, with first right of refusal for renewal. In wet years, WDWA GSA JPA member districts have the ability to purchase and bank surplus surface water supplies

within the Pioneer Project and Berrenda Mesa Spreading Grounds for later recovery in dry years. In comparison to other agricultural water districts that can utilize groundwater supplies in dry years, WDWA GSA JPA member districts are 98% dependent upon imported surface water and, as a result, purchase water at market-driven prices as needed. As a result, even in critically dry years, WDWA GSA member districts have demonstrated success acquiring significant volumes of supplemental surface water supplies. For example, in 2022, a critically dry year and second back-to-back year of 5% allocation on the SWP, WDWA GSA member districts were able to acquire nearly 40,000 AF (costing approximately \$54,000,000) in supplemental surface water supplies while other water districts reverted to significantly less expensive groundwater supplies. In addition to historical success acquiring surface water supplies, the Department of Water Resources (DWR) amended the SWP water supply contracts with all SWCs in 2021 to include new “water management tools” that allow for greater flexibility on transfers and exchanges between SWCs. The revised “water management tools” increases WDWA GSA’s member districts’ ability to acquire supplemental surface water supplies from other SWCs, when needed.

WDWA-2 Conjunctive Reuse of Degraded Brackish Groundwater: The project, which is in its initial stages of development, will integrate modular treatment and beneficial conjunctive reuse of brackish groundwater and oil field produced water. A Phase I engineering feasibility study has been completed. Next steps include negotiations with project partners, identifying funding options, and development of a Front End Engineering Design (FEED) study. Current estimates indicate this project could come online in 2030. When all project phases are complete, the project would provide approximately 50,000 AFY of treated water derived from non-conventional resources.

WDWA-3 Delta Conveyance Project: WDWA’s member districts currently participate in the funding the current Delta Conveyance Project via payments made member units of the Kern County Water Agency. While future benefits from this in process project are anticipated, benefits are not currently included or relied upon to maintain groundwater sustainability within WDWA GSA (i.e., zero water budget deficit).

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

WDWA-4 Net Zero Well Drilling Moratorium within Close Proximity to Critical Infrastructure: To further refine the current understanding of the causes of subsidence along the California Aqueduct Mileposts 195-215, fill potential future data gaps, and address previous comments made by the California Aqueduct Subsidence Program (CASP), WDWA GSA implemented a net-zero well drilling moratorium within the CASP 5 mile-wide California Aqueduct “Buffer Zone”. The PM/A prohibits new groundwater extraction well drilling within the CASP Buffer Zone unless explicitly approved by the

WDWA GSA Board, which may allow replacement wells only if an existing groundwater extraction well within the Buffer Zone is abandoned. The purpose of this management action is to ensure there is no increase of GSA-related groundwater extraction within the CASP Buffer Zone. This management action was developed utilizing stakeholder input gathered over five direct meetings with impacted stakeholders, including CASP, and two public WDWA GSA board meetings. The full text of this management action can be found on WDWA GSA's website: <https://www.westsidedwa.org/>.

WDWA-5 Mandatory Well Registration: To further supplement the Kern County Subbasin Well Registry management action (KSB-7), WDWA GSA has implemented a mandatory well registration program that requires all currently existing and future groundwater extraction wells drilled within WDWA GSA register with the GSA. Information required from well owners includes well construction reports and water quality data, if available. The policy also requires new wells to have a flowmeter installed and allow the GSA to use the well for monitoring, if located in an identified data gap area. Well owners are required to provide annual status updates to the GSA for each well. This management action was developed utilizing stakeholder input gathered over five direct meetings with impacted stakeholders, including CASP, and two public WDWA GSA board meetings. The full text of this management action can be found on WDWA GSA's website: <https://www.westsidedwa.org/>.

WDWA-6 Well Extraction Volume Reporting Within Close Proximity to Critical Infrastructure: To further refine the current understanding of the causes of subsidence along the California Aqueduct Mileposts 195 to 215, fill potential future data gaps, and address previous comments made by CASP, all well owners within the CASP Aqueduct Buffer Zone are required to report annual groundwater extraction volumes (as measured by flowmeter) to the GSA. This management action was developed utilizing stakeholder input gathered over five direct meetings with impacted stakeholders, including CASP, and two public WDWA GSA board meetings. The full text of this management action can be found on WDWA GSA's website: <https://www.westsidedwa.org/>.

WDWA-7 CASP Collaboration and Data Sharing Agreement: To further refine the current understanding of the causes of subsidence along California Aqueduct Mileposts 195-215 and fill potential future data gaps, the WDWA GSP is developing a collaborative data sharing agreement with CASP. Components of the agreement may include:

- Quarterly technical meetings with CASP
- Sharing of GSA-related well location and extraction volumes
- Annual review of subsidence rates measured by InSAR and CASP collected data.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- Improve the understanding of the groundwater response to the implementation of P/MAs.
- Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.

- Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by WDWA GSA related activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in **Appendix W**. If either the projects or management actions are unable to produce the projected supplies or more cost-effective alternatives arise, WDWA GSA may deviate from the actions described above. At each 5-year planning window, each previously described project and management action will be evaluated, and new projects and management actions considered for implementation. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path’s implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement. As previously discussed, WDWA GSA does not have a groundwater deficit, thus WDWA GSA has already achieved the “Glide Path” 2020-2040 five-year milestones and total deficit reduction goal and is not required to implement

additional deficit reduction measures. The anticipated P/MA implementation schedule presented forecasts WDWA GSA ability to continue to remain in groundwater surplus through 2040.

P/MAs have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. WDWA GSA board meetings are noticed and open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and as shown in Table 142 WDWA GSA does not have a minimum target P/MA goal. WDWA GSA does not currently have nor, is it projected to have, a groundwater deficit. The projected water budget indicates that under the 2030 Climate Change Scenario, imported water supplies to the WDWA GSA may be reduced. However, this modeled reduction in surface water supply would not have a significant effect on WDWA GSA's ability to maintain a groundwater surplus due to the magnitude of WDWA GSA's currently modeled surplus and the inability to significantly increase groundwater extractions due to poor groundwater quality. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in *Circumstances for Implementation*, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 2.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential supplemental water supplies for PMA WDWA-1 could come from the following sources:

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor's place of service for future use. BMWD, BWSD, and LHWD currently receive SWP water through a water supply contract (combined entitlement of 333,218 AFY) with Kern County Water Agency, one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and imported into Kern County. When applicable, BWSD, BMWD, and LHWD also participate in the State Water Project dry-year program, facilitated by the State Water Contractors, which provides SWCs with the ability to purchase additional surface water in low SWP allocation years from partners who make water available via groundwater substitution, reservoir re-operations, and rice fallowing. In addition to already contracted SWP Table A entitlement, BWSD, BMWD, and LHWD have multiple long-term purchase agreements in place with other SWCs to purchase varying volumes of supplemental supplies, providing an additional consistent source of supplemental surface water. BMWD, BWSD, and LHWD are active participants in the Kern Fan Banking Projects, which allow the districts to store acquired surface water for later use during times of drought.

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. While WDWA GSA's districts (BMWD, BWSD, and LHWD) are not CVP contractors, BWSD has some land located within the CVP place of use (POU). BMWD, BWSD, and LHWD have historically purchased supplemental surface water from CVP contractors and utilized the surface water in-district via exchange or application to lands within the BWSD's CVP POU.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts

mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion. When available, WDWA GSA member districts can receive Kern River water through water service agreements with the Kern County Water Agency. In addition, WDWA GSA member districts have existing, long-term agreements with district partners outside of Kern County to purchase and import conserved pre-1914 water.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Due to naturally occurring poor groundwater quality, there are no groundwater recharge or storage projects implemented or planned for future implementation within WDWA GSA's boundaries.

Legal Authority Required

23 CCR § 354.44(b)(7)

WDWA GSA is a JPA comprised of BMWD, BWSD, and LHWD and possesses the legal authority to implement the P/MAs discussed herein. Per California Water Code (CWC) § 10725 through 10726.8, WDWA GSA also possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- BMWD, BWSD, and LHWD district assessments and/or water charges.

- Grant funding from sources including, but not limited to DWR, SRWCB, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for WDWA GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Westside District Water Authority GSA	Estimated Costs	
	One-time	Annual
Implemented	\$10,000	\$10,053,000
Functional		
In-Process	\$72,495,349	\$6,107,500
As-Needed		
Total	\$72,505,349	\$16,160,500

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, the primary means any future potential deficits will be addressed is through implementation of P/MAs that reduce demand and/or augment supply using the water supply sources identified herein.

In addition to utilizing PM/A WDWA-1 to supplement imported surface water supplies, PM/A WDWA-2 would utilize treatment of degraded brackish water for conjunctive reuse to produce a new supplemental water supply. PM/A WDWA-2 is not assumed to be functional until at least 2030. An initial feasibility study had been completed and next steps are in process. However, WDWA-2’s supplemental supplies are not needed to maintain groundwater sustainability within WDWA GSA; rather, treated supplies would represent additional irrigation supply derived from non-conventional, drought tolerant sources.

In addition to these supply augmentation projects, WDWA GSA also included a policy-based management action aimed at demand reduction in the form of a voluntary fallowing program (WDWA-8). Via a combination of naturally occurring poor groundwater quality limiting agricultural and beneficial use of groundwater within WDWA GSA, and the implementation of the PM/As presented herein, WDWA GSA will continue to maintain the groundwater supply surplus within the GSA through 2040 and beyond.

West Kern Water District GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- 23 CCR § 354.44(a)
- 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin’s (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage “deficit” of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA’s individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address

25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

(b) Implementation Glide Path – West Kern Water District (WKWD) GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the exact schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for WKWD GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (0 AFY) of the projected deficit of 0 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2020.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example WKWD-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with "KSB-#" which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin's Sustainability Goal. All P/MAs are described in detail on the tables below.

Table 3. (GSA P/MAs)

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits							Source(s) of Water	Legal Authority Required	Estimated Costs

KSB-2	Coordination with Groundwater Regulatory Programs	Coordination with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, SAFER projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking MOU's.	✓	✓			When domestic or small community wells require assistance maintaining access to safe and reliable water supplies.	Refer to Subbasin Outreach and Engagement Plan	NA	Implemented	2020	2020-	0	0	✓			NA	NA	\$0	\$25,000	Rate Payers, Grants				
KSB-3	Exceedance Policy	Subbasin wide policy to provide protocols for groundwater GSAs to investigate exceedances. This policy is developed in conjunction with the Subbasin Well Mitigation Program which identifies mitigation strategies for vulnerable communities.	✓	✓	✓		When an MT exceedance occurs for any sustainability indicator.	NA	NA	Implemented	2024	2024-	0	0			✓	✓	NA		\$0	\$25,000	Rate Payers, Grants			

KSB-4	Coordination with Basin Study	Coordination with local GSA's to gain a better understanding of the Kern Subbasin and how best to manage for sustainability, native yield, subsurface flow, and evapotranspiration. The further development of the data management system to improve data access and transparency.	✓	✓	✓		Supporting data collection, reviewing and validating results with GSA-specific data.	NA	NA	Ongoing	2025	2025-	0	0				✓	NA	NA	\$25,000	\$0	Rate Payers, Grants	
KSB-5	Domestic Well Mitigation	Development of a subbasin domestic and small community well mitigation program to assist with financial aspects of emergency water supplies and well improvement and replacement due to lowering of groundwater levels.	✓	✓			When declining groundwater levels impact domestic or small community wells.	Refer to Subbasin Outreach and Engagement Plan	NA	Initiating Development	2025	2025-	0	0				✓	NA	NA	\$0	\$45,000	Rate Payers, Grants	
KSB-6	White Land Demand Management	Development of governance structure and demand reduction action for Subbasin white lands (lands not within a district or management area). Correct the water supply imbalance by setting water budgets and a linear reduction of 10% per year over the planning period of 2030-2040.	✓	✓	✓	Demand Reduction	Subbasin-wide overdraft correction.	Stakeholder Meetings Board Meetings Hearings Public Outreach & Engagement	NA	Initiating Development	2030	2030-	0	20,410	✓			✓	NA	None	\$0	\$10,000	Rate Payers, Grants	
KSB-7	Well Registry	Maintain and improve 2024 Subbasin well inventory in the DMS platform with added data from field surveys, current beneficial use determinations, and coordination with Kern County Environmental Health and DWR to track new wells, etc.	✓	✓	✓			Refer to Subbasin Outreach and Engagement Plan	NA	Ongoing	2024-	2024-	0	0				✓	✓	NA	NA	\$0	\$25,000	
KSB-8	Consumptive-Use Study	Maintain and improve existing Subbasin consumptive-use study (ITRC Metric/LandQ) for accurate estimates of water use by parcel within GSA's.	✓	✓	✓			Refer to Subbasin Outreach and Engagement Plan	NA	Ongoing	2020-	2020-	0	0				✓	✓	NA	NA	\$0	\$25,000	
WKWD-4	Continued Participation in Basin-Wide Coordination	Coordinate with all other GSA's within the Kern Subbasin to address regulatory requirements and determination.	✓	✓	✓	Exercise of Rights	NA	Stakeholder Meetings Board Meetings	NA	In-Process	2040	2020-	0	0	✓	✓	✓	✓	✓	NA	NA	\$0	\$100,000	Rate Payers, Grants
WKWD-5	Continued Balanced Pumping and Recharge	Continued balanced pumping of groundwater and recharge of imported supplies has and will continue to be the operational norm for WKWD. Under this management action, recharge and recovery activity will continue to be monitored closely by WKWD to maintain balanced conditions.	✓	✓	✓		As-needed	NA	NA	As-Needed	NA	NA	0	0	✓		✓		NA	NA	\$0	\$0	NA	
WKWD-6	Implement Water Shortage Response Plan	Implement conservation measures during drought periods	✓	✓	✓	Demand Reduction	As-needed	Stakeholder Workshops, Board meeting, customer communications	NA	As-Needed	NA	NA	0	2500			✓	✓	NA	NA	\$0	\$0	NA	
WKWD-7	Taft Recycled Water Program	The Taft Recycled Water Program could potentially generate 423 AFY of tertiary recycled water for Title 22 approved applications.	✓	✓	✓	New Local Supply	As-needed	Stakeholder Workshops, Board meeting, customer communications	Construction permits, General Waste Discharge Requirement Permit,.	As-Needed	NA	NA	423	0	✓		✓	✓	Recycled Water	NA	\$14,455,000	\$415,000	Rate Payers, Grants	
WKWD-8	Shift Balance of Pumping between North and South Wellfields	Shifting and balancing pumping between the North Wellfield and South Wellfield entails WKWD increasing the proportion of groundwater pumped at the wellfield that is experiencing the least decline in groundwater levels. This strategy would allow local recovery of groundwater levels in the other wellfield.	✓	✓	✓		As-needed	NA	NA	As-Needed	NA	NA	0	0	✓		✓		NA	NA	\$0	\$0	NA	
WKWD-9	Implement Permanent Demand Management Measures	This adaptive management strategy would convert the Response Level 1 actions in the WSRP from voluntary to mandatory. These water restrictions would require a 25 percent reduction in large landscape watering from 2007 levels, prohibit water waste, and reduce non-contracted industrial water use by 15 percent from 2007 levels.	✓	✓	✓	Demand Reduction	As-needed	Stakeholder Workshops, Board meeting, customer communications	NA	As-Needed	NA	NA	0	2500			✓	✓	NA	NA	\$0	\$0	NA	

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 0 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific P/MAs either **currently being implemented** or **which have been implemented** or **in-process** that contribute to water demand reduction include:

WKWD-1 Automatic Meter Reading Project = Includes the installation of Automatic Meter Readers on all residential and commercial customers in the WKWD service area, monitoring for leaks and encouraging customers to reduce water consumption through near-real-time data using an on-line monitoring tool

WKWD-2 Buena Vista Recreation Area Water Supply Management Coordination = Includes the coordination with Kern County on the operation and groundwater extractions required for the Buena Vista Recreation Area. Through this coordination, efficiency, demand reduction, and better understanding of future demands may assist the WKWD in reducing long term demands.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in Appendix V. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in **Appendix T**. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory

Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see **Appendix U**). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see **Appendix K**) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025 with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.
- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly's Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in **Appendix V**.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by WKWD GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts. Several projects and management actions have been identified and listed **"As Needed"** on Table 3. and could reduce the deficit by up to 5,423 AFY if needed to help maintain the WKWD GSA's Sustainability.

WKWD-5 Continued Balanced Pumping and Recharge – Continued balanced pumping of groundwater and recharge of imported supplies has and will continue to be the operational norm for WKWD. Under this management action, recharge and recovery activity will continue to be monitored closely by WKWD to maintain balanced conditions.

WKWD-6 Implement Water Shortage Response Plan – This adaptive management strategy would implement conservation measured during drought periods for WKWDs customers to reduce demand. This could reduce demands by 2,500 AFY.

WKWD-7 Taft Recycled Water Program – The Taft Recycled Water Program could potentially generate 423 AFY of tertiary recycled water for Title 22 approved applications.

WKWD-8 Shift Balance of Pumping between North and South Wellfields – Shifting and balancing pumping between the North Wellfield and South Wellfield entails WKWD increasing the proportion of groundwater pumped at the wellfield that is experiencing the least decline in groundwater levels. This strategy would allow local recovery of groundwater levels in the other wellfield.

WKWD-9 Implement Permanent Demand Management Measures – This adaptive management strategy would convert the Response Level 1 actions in the WSRP from voluntary to mandatory. These water restrictions would require a 25 percent reduction in large landscape watering from 2007 levels, prohibit water waste, and reduce non-contracted industrial water use by 15 percent from 2007 levels. This action could reduce demand by 2,500 AFY.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MAs will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MAs have been categorized on (GSA P/MAs) as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MAs had been initiated pre-2020 and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MAs had been initiated and have since been completed. Several other P/MAs were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MAs are In-Process somewhere between Feasibility and Construction/Implementation. All the In-Process P/MAs will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting process that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in **Section 14.1.2** and shown in Table 14-2, the WKWD GSA does not have a minimum target P/MA goal. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).

- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage, consumptive use) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (WKWD-2 and general operations) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. If conveyance is available, this surplus CVP water could be delivered from the Friant-Kern Canal through the CVC to WKWD facilities.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor’s place of service for future use. WKWD currently receives SWP water through a water supply contract (Table 1 Entitlement 31,500 AF) with Kern County Water Agency (KCWA), one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if conveyance capacity exists, can be purchased, and stored for future use. WKWD purchases excess Article 21 water through its State Water Contractor for delivery to existing project recharge facilities using the CVC when such water is available.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to

post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion.

WKWD currently receives Kern River water when it is available for water recharge through water service agreements with KCWA.

3rd Party Programs

WKWD has long operated as 3rd party banking program for several Kern County Kern County agencies. Over the past several years more interest has been expressed in participating in WKWD's project for drought protection needs. Most of these programs are structured on a 2:1 basis, meaning for every acre-foot stored for the 3rd party for later drought supply, WKWD receives one for providing banking capacity. These supplies come from the above three identified sources and have provided groundwater supply for WKWD and drought protection for the 3rd party.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Because WKWD is a water district and surface water banking operation, developing additional recharge projects and storage projects outside its project vicinity is not a priority at this time.

Legal Authority Required

23 CCR § 354.44(b)(7)

The WKWD is a water district that operates a surface water banking project t, and possesses the legal authority to implement P/MAs discussed herein. WKWD GSA is also a GSA, per California Water Code (CWC) § 10725 through 10726.8, the GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 3. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to

initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 3, and include the following:

- District assessments and/or water charges.
- Grant funding from sources including DWR, United States Bureau of Reclamation (USBR), and CA WISP.

Estimated costs for WKWD GSA P/MA’s by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

West Kern Water District GSA	Estimated Costs	
	One-time	Annual
Implemented	\$1,500,000	\$50,000
Functional		
In-Process	\$25,000	\$905,000
As-Needed	\$14,455,000	\$415,000
Total	\$15,980,000	\$1,370,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase, water conservation, storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management

actions aim to reduce overall water demand through newly implemented water metering and efficiencies programs, while others can be enacted as needed to reduce demands within the GSA. Through this combination of increased recharge during wet years, demand reduction, coordination, and continued successful sustainable and balanced utilization of groundwater resources, the GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.

Wheeler Ridge-Maricopa Water Storage District GSA Projects and Management Actions

Goals and Objectives of Projects and Management Actions

- ☑ 23 CCR § 354.44(a)
- ☑ 23 CCR § 354.44 (b)(1)(A) and (B)

The objectives of Projects and Management Actions (P/MAs) are to achieve the Kern County Subbasin's (Subbasin) Sustainability Goal through implementation of a glide path that will result in closing the estimated Subbasin groundwater storage deficit of 372,120 acre-feet per year (AFY) under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline, as well as address data gaps and provide for mitigation measures to protect beneficial users.

Each Groundwater Sustainability Agency (GSA) developed P/MA's individually and collectively as a Subbasin. Evaluation of components such as costs, viability, and benefits, was all completed at a GSA level. The coordinated goal of the P/MA Planned Deficit Reduction for each GSA is to meet (with some flexibility) each interim milestone and to eliminate their respective deficit reduction goal by 2040.

The Subbasin GSAs, as it relates to this planning document, have agreed to use a historical supply and demand analysis using a checkbook approach to determine the minimum target P/MA goal for each individual GSA. This is for P/MA planning purposes only, as these values are not considered final, and will be revised during the Basin Study KSB-4. Minimum target P/MA goals for each GSA were calculated using this historical checkbook surface water supply and demand analysis for the 2010-2019 period, then applying an adjustment for estimated climate change which results in increased minimum target P/MA goal above historical levels. These estimates are for P/MA planning purposes only and will be updated in subsequent planning cycles, informed by Basin Study management action KSB-4.

(a) Implementation Glide Path Kern County Subbasin

- ☑ 23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address existing overdraft conditions that could trigger Undesirable Results as P/MAs are incrementally implemented to achieve the sustainability goal. While the exact schedule and timetable for implementation of the individual P/MAs is not known at this time, general implementation schedules, also known as a glide path, have been developed as

summarized in Table 1 and illustrated on Figure 1. This glide path is aimed to address 25 percent (93,000 AFY) of the projected deficit of 372,000 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the Subbasin as shown in Table 1. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction by 2030 and exceed the 2040 milestone with a safety factor of 2.0, illustrating an extremely high degree of P/MA redundancy. A sensitivity analysis is illustrated on Figure 1 for both 50 percent and 75 percent actual realized benefits from P/MAs. Even if only 50 percent of P/MA benefits are realized, 102 percent of the projected deficit would be eliminated by 2040. Figure 2 and Figure 3 depicts that the Subbasin will rely on 317,000 AFY of demand reduction to mitigate the 372,000 AFY deficit and has identified as-needed projects available for development that would provide an additional estimated 71,000 AFY of deficit reduction capacity, bringing the total safety factor to 2.2 times the planned goal.

Figure 2.(P/MA by Category)

(b) Implementation Glide Path – Wheeler-Ridge Maricopa GSA

23 CCR § 354.42(d)

As stated above, the goals and objectives of the P/MAs presented herein are to address any existing or potential Undesirable Results by the GSP implementation deadline for Kern County Subbasin (i.e., by January 2040). As such, P/MAs will be implemented incrementally to achieve this goal. While the schedule and timetable for implementation of all individual P/MAs is not exactly known at this time, general implementation schedules, also known as a “Glide Path,” have been developed as summarized for Wheeler-Ridge Maricopa GSA Table 2 below and illustrated on Figure 3. This “Glide Path” is aimed to address 25 percent (4,728 AFY) of the projected deficit of 18,910 AFY during each five-year milestone through 2040, which in turn will affect conditions of the relevant Sustainability Indicators based on the assumption that those conditions are directly related to the balance of supplies and demands within the GSA. The anticipated P/MA implementation schedule is forecasted to exceed the target deficit reduction as early as 2025.

List of Projects and Management Actions

§ 354.44. Projects and Management Actions

- (a) *Each Plan shall include a description of the projects and management actions the Agency has determined will achieve the sustainability goal for the basin, including projects and management actions to respond to changing conditions in the basin.*
- (b) *Each Plan shall include a description of the projects and management actions that include the following:*
 - (1) *A list of projects and management actions proposed in the Plan with a description of the measurable objective that is expected to benefit from the project or management action. The list shall include projects and management actions that may be utilized to meet interim milestones, the exceedance of minimum thresholds, or where undesirable results have occurred or are imminent. The Plan shall include the following:*
 - (A) *A description of the circumstances under which projects or management actions shall be implemented, the criteria that would trigger implementation and termination of projects or management actions, and the process by which the Agency shall determine that conditions requiring the implementation of particular projects or management actions have occurred.*
 - (B) *The process by which the Agency shall provide notice to the public and other agencies that the implementation of projects or management actions is being considered or has been implemented, including a description of the actions to be taken.*
 - (2) *If overdraft conditions are identified through the analysis required by Section 354.18, the Plan shall describe projects or management actions, including a quantification of demand reduction or other methods, for the mitigation of overdraft.*
 - (3) *A summary of the permitting and regulatory process required for each project and management action.*
 - (4) *The status of each project and management action, including a time-table for expected initiation and completion, and the accrual of expected benefits.*
 - (5) *An explanation of the benefits that are expected to be realized from the project or management action, and how those benefits will be evaluated.*
 - (6) *An explanation of how the project or management action will be accomplished. If the projects or management actions rely on water from outside the jurisdiction of the Agency, an explanation of the source and reliability of that water shall be included.*
 - (7) *A description of the legal authority required for each project and management action, and the basis for that authority within the Agency.*
 - (8) *A description of the estimated cost for each project and management action and a description of how the Agency plans to meet those costs.*
 - (9) *A description of the management of groundwater extractions and recharge to ensure that chronic lowering of groundwater levels or depletion of supply during periods of drought is offset by increases in groundwater levels or storage during other periods.*
- (c) *Projects and management actions shall be supported by best available science.*
- (d) *An Agency shall take into account the level of uncertainty associated with the basin setting when developing projects or management actions.*

P/MAs are numbered with the acronym of the GSA (example WRM-1) if the P/MA is specific to the individual GSA. Subbasin-wide P/MAs are labeled with “KSB-#” which represents P/MAs that all – or nearly all - GSAs are participating in to achieve the Subbasin’s Sustainability Goal. All P/MAs are described in detail on the tables below.

P/MA Number	P/MA Name	Summary Description	Relevant Sustainability Indicators Affected			Overdraft Correction Description Category	Circumstances for Implementation	Public Noticing Process	Permitting and Regulatory Process Requirements	Status	Timetable for Completion	Timetable for Accrual of Expected Benefits	Expected Benefits							Source(s) of Water	Legal Authority Required	Estimated Costs			
			Groundwater Levels & Storage	Groundwater Quality	Land Subsidence								Primary (AFY)		Secondary							One-time Costs	Ongoing Costs (per year)	Potential Funding Source(s)	
													Water Supply Augmentation	Demand Reduction	Water Quality Improvement	Flood Control	Water Management Feasibility/Efficiency	Mitigation Programs	Data Gap Filling/ Monitoring						
Management Actions		Implemented	Functional	In-Process	As-Needed							Implemented	Functional	In-Process	As-Needed

This page intentionally left blank.

Demand Reduction P/MAs

Demand Reduction P/MAs are the primary means of implementation of a “Glide Path” that will result in closing the currently identified “deficit” of 18,910 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA Specific P/MAs either **currently being implemented or which have been implemented** or **in-process** that contribute to water demand reduction include:

WRM-8 Pumping Assessment = Through a recently approved Groundwater Service Charge (GWSC) to be levied on each acre-foot of groundwater extracted for consumptive use within Wheeler Ridge Maricopa Water Storage District (WRMWSD) boundaries, with some exceptions, beginning as early as 2024, an approximately 2,000 AFY demand reduction benefit is expected.

WRM-12 Land Retirement = Through either District or landowner actions, by purchasing and permanently fallowing previously irrigated acreage within District to reduce overall water demand and groundwater extractions, a 10,000 AFY reduction in demand is anticipated, with an increase by 2,500 AFY after 2030.

KSB-6 White Land Demand Management – The Subbasin is developing a governance structure and demand reduction action for Subbasin white lands (lands not within a district). As part of the implementation of KSB-6 there would be another round of public outreach to include remaining white land landowners. Previous stakeholder outreach efforts accomplished GSA management of over 150,000 acres of white lands that were absorbed via agreement with various GSAs and managed for sustainability. Approximately 7,200 acres of white lands (less than 1% of the Subbasin) remain currently using groundwater (irrigated agriculture and urban) to have management actions assigned. KSB-5 Basin Study will provide added technical data to support setting water budgets necessary to implement a linear white lands demand reduction schedule of 10 percent per year, estimated at a total of 20,410 AF over the planning period of 2030-2040. Additional details are provided in the Kern Non-District Lands Authority Joint Powers Agreement governance document in Appendix D. Due to the white land’s relatively small groundwater demand, implementing white land demand management in the 2025-2030 period will not preclude the Subbasin’s ability to meet its sustainability goal.

Water Supply Augmentation P/MA’s

Water Supply Augmentation P/MAs are the secondary means of implementation of a “Glide Path” that will result in closing the balance of the currently identified “deficit” of

18,910 AFY under the 2030 Climate Change Scenario by the January 2040 GSP implementation deadline.

GSA-specific Projects either **currently being implemented** or **have been implemented** or **in-process** that contribute to supply augmentation include:

WRM-1 Increase Out-of-District Banking Operations = Through increasing size and/ or participation in out-of-District banking facilities (i.e., Kern Water Bank and Pioneer Project), the associated increase in banking of wet year supplies outside of the District would support deliveries of imported water into the District in normal/dry years. The estimated average recharge benefit from this project is 9,225 AF/month, or 6,730 AFY.

WRM-2 Purchase Additional Supplies = By continuing to purchase additional supplies, as available, for banking outside of the District or direct delivery within the District, an estimated 5,000 AFY benefit is expected.

WRM-3 On-Farm Recharge = Through establishing the Landowner Recharge Program in April 2023, WRMWSD pays participating landowners \$75/AF to spread certain low-cost water supplies available to WRMWSD on private lands not subject to perched water or overlying poor quality groundwater. Through this program, up to an estimated 18,000 AFY of WRMWSD's supply will be recharged through this project in wet years, or 3,600 AFY on average when considering non-wet years.

WRM-4 "Thru Delta" Facility = Participation in a "Thru Delta" Facility will increase access to contracted (SWP) supplies. Participation in the Delta Conveyance Project (DCP) will allow the District to firm up its existing SWP entitlement and may also enable participants to gain access to additional non-firm supplies that can be conveyed through the Delta. It is estimated that this project could provide up to 25,000 AF of surplus supply upon completion in wet years, or 5,000 AFY on average when considering non-wet years. However, because of delays associated with the DCP, the anticipated benefits from this project are not anticipated to start until at least 2045, and therefore are not currently included in the implementation "Glide Path".

WRM-5 In-District Banking Facilities = Through a program to promote private and/or WRMWSD-owned banking facilities within the District, the District estimates it could recharge up to 10,000 AF in wet years through this program, or 2,000 AFY on average when considering non-wet years.

WRM-13 Capture of Imported Water Return Flows from White Wolf Subbasin = Inflows from the White Wolf Subbasin can be attributed to return flows of imported surface water deliveries by Arvin-Edison Water Storage District (AEWSD) and WRMWSD to landowners within the White Wolf Subbasin. The average benefit of 9,000 AFY will be split equally between AEWSD and WRMWSD (4,500 AFY).

Data-Gap Filling and Mitigation Efforts

To address identified data-gaps, Management Actions either currently being implemented or have been implemented that contribute to data-gap filling and mitigation efforts include:

WRM-11 Groundwater Extraction Quantification Method = Set binding pumping limitations in conjunction with a fee for pumping above limits.

KSB-1 Friant-Kern Canal Capacity Mitigation – The Subbasin is working to implement this project shown in more detail in Appendix T. Conveyance conditions of the Friant-Kern Canal (FKC) have been impacted by historical subsidence and will potentially be impacted by future subsidence under the proposed implementation of the Subbasin GSPs. The Friant Water Authority (FWA) position regarding subsidence along the FKC is that “any unmitigated conveyance loss due to subsidence beyond 2020 would lead to undesirable results”. Sustainable management criteria (SMCs) have been proposed for the FKC that limit subsidence to a 5-year annual average rate of 0.1 feet per year with a maximum 3 feet of cumulative subsidence from 2015 to 2040. Beyond 2040, subsidence is to be minimized with zero average subsidence (including residual subsidence) attributable to groundwater pumping under GSA jurisdiction. To address post-2020 subsidence along the FKC, a mitigation program consisting of raising the sides (liner) of the canal and upgrading associated facilities/infrastructure such as bridge crossings, check structures, wasteways, turnouts, inlet drains, siphons/underdrains, power and telephone and various size pipelines is proposed. The mitigation program will be partially funded by GSAs within the Kern Subbasin, based on the relative impact of post-2020 pumping and groundwater overdraft on subsidence along the FKC. FWA is evaluating several Lower Reach Capacity Correction alternatives including achieving the original design conveyance capacity of 2,500 cubic feet per second (cfs). FWA has performed their own forecast of future subsidence in a reconnaissance-level study (Note: the FWA future subsidence forecast is less than historical rate from 2015 to 2023 used to develop the FKC subsidence minimum threshold and assumes groundwater levels stabilizing quickly during implementation of the GSPs). FWA’s position is that the Subbasin GSAs should minimize and mitigate lost conveyance capacity post-2020 due to ongoing subsidence attributable to groundwater pumping under GSA jurisdiction.

As part of this P/MA, the Subbasin would implement the following: 1) participate in a program that monitors and tracks ongoing subsidence regionally within the Subbasin and locally along the FKC, 2) compare observed rates of subsidence to established SMCs along the FKC and take action such as pumping reductions should future observed subsidence rates exceed interim milestones and the minimum threshold, 3) collaborate with FWA to develop costs estimates for the Lower Reach Capacity Correction and evaluate the degree of post-2020 lost capacity attributable to subsidence, 4) develop an attribution analysis of post-2020 subsidence impacts using

either a numerical model to perform predictive analysis or other suitable tool, and 5) develop and implement a funding mechanism based on the subsidence attribution analysis to pay for post-2020 conveyance impacts on the FKC attributable to subsidence.

KSB-2 Coordination with Groundwater Regulatory Programs – The Subbasin will continue to coordinate with various water quality regulatory programs by local, state, and federal agencies. Some of these programs include the Irrigated Lands Regulatory Program, Safe and Affordable Funding for Equity and Resilience Program (SAFER) projects, Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS), as well as local Groundwater Banking Memorandums of Understanding (MOUs), which mandates the sampling of monitoring wells and adherence to mitigation measures to protect groundwater quality.

KSB-4 Coordination with Basin Study – The Subbasin has coordinated to perform an updated Basin Study (see Appendix U). The work will address data and information gaps and recalibrate the Subbasin model. The update will:

- a. Improve the understanding of the groundwater response to the implementation of P/MAs.
- b. Develop an improved determination of the input data to address data gaps for Subbasin-wide and local water budgets.
- c. Incorporate locally derived hydrogeologic conceptual model data from the Subbasin Plan into the model to better represent subsurface groundwater flow within and out of the Subbasin.
- d. Improve model calibration to better simulate groundwater levels with respect to minimum thresholds and measurable objectives.

KSB-5 Domestic Well Mitigation – The Subbasin has executed a Letter of Intent (see Appendix K) to fund and implement a subbasin-wide domestic and small community well mitigation program starting January 1, 2025, with Self-Help Enterprises (SHE) as follows:

- a. Emergency Bottled Water – Upon notice that a domestic well user has lost access to water, SHE distributes 2 weeks' worth of bottled drinking water to the household within 24 hours.
- b. Well Assessment – SHE staff conduct on-site assessments which includes review of well reports/documentation, confirming water source, checking for running water/water pressure, assessing well depth and water level, inspecting electrical and above-ground components, inspecting any existing tank systems, identifying locations for new tank system placement, and developing a site map.

- c. Temporary Tanks and Hauled Water – If necessary, SHE arranges for installation of a tank system and routine delivery of hauled potable water to the site. Repair and maintenance services are provided to the system until removal.
- d. Ongoing Bottled Water – SHE coordinates deliveries of ongoing bottled drinking water until a long-term solution is in place.
- e. Long-Term Solutions – SHE finances, as provided by the GSAs, well repairs, well replacement, and service connections to nearby water systems (whenever feasible) to restore long-term water access to the home.

KSB-7 Well Registry – The Subbasin as part of the 2024 GSP amendment process developed a more accurate inventory based on available databases and field verifications. This management action will include the improvement and maintenance of a well registry made available in the local data management systems. At least annually, the Subbasin will update the system from DWR/County well permit information and well surveys.

KSB-8 Consumptive-Use Study – The Subbasin has annually contracted with either Cal Poly’s Irrigation Training Research Center and/or LandIQ for monthly evapotranspiration data of the Subbasin for both planning and, in some GSAs, for groundwater extraction fee calculation purposes. The Subbasin will continue this effort and invest in improved technology and processes for improved accuracy. See proposal document in Appendix V.

Adaptive Management Efforts

To the extent that projects and management actions are unable to prevent Minimum Threshold Exceedances that are caused by Wheeler-Ridge Maricopa GSA activities, further actions will be evaluated and considered as directed by KSB-3 Exceedance Policy attached in Appendix W. If either the projects or management actions are unable to produce the projected supplies or other better options are found that prove more cost-effective the GSA may deviate from the actions as described above. At each 5-year planning window, each previously described project and action will be evaluated as well as new ones possibly included. The GSA will enact P/MAs to accomplish at least a linear path to sustainability. Progress on the glide path's implementation will be presented annually via the Kern County Subbasin Annual Report and inform adaptive management efforts.

Several P/MAs have been identified and listed **“As Needed”** on Table 3. (GSA P/MAs) and could reduce the deficit by up to 31,000 AFY if needed, as summarized below:

WRM-6 Expand District Distribution System – The Wheeler-Ridge Maricopa Water Storage District could expand their distribution system to include areas currently using only private groundwater. This expansion could augment supply by 2,000 AFY.

WRM-7 Desalination Facilities – By construction desalination facilities, additional poor-quality groundwater could be processed and later used for agriculture thereby easing demand from the Primary Alluvial Principal Aquifer. Exact demand reduction is unknown.

WRM-9 Groundwater Allocation and Market – Through development of a groundwater pumping allocation methodology, including a system for trading and transferring allocations, a 21,000 AFY reduction in demand could be realized.

WRM-10 Voluntary Pumping Limitation – By setting a non-binding pumping limitation in conjunction with a fee for pumping above prescribed limits demand could be reduced. At this time the exact demand reduction quantity is unknown and would be dependent on participation.

WRM-11 Mandatory Pumping Limitation – Through setting a mandatory, binding pumping limitation in conjunction with a fee for pumping above limit, a demand reduction of up to 5,000 AFY could be realized.

Circumstances for Implementation

23 CCR § 354.44(b)(1)(A)

As discussed above, an overall P/MA implementation schedule, or preliminary “Glide Path” has been developed as a framework to guide the level of benefits that are planned to be achieved over the GSP implementation period (i.e., until 2040), and further through the SGMA planning and implementation horizon (i.e., through 2070). P/MA’s will be implemented in such a way as to meet the “Glide Path” Milestones as a minimum requirement.

P/MA’s have been categorized on Table 3 as: **Implemented**, **Functional**, **In-Process**, or **As-Needed**.

Implemented – In anticipation of SGMA several P/MA’s had been initiated pre-2020 and have since been completed. Several other P/MA’s were developed in response to SGMA and have since been completed and are accruing benefits.

Functional – In response to SGMA several P/MA’s had been initiated and have since been completed. Several other P/MA’s were developed in response to SGMA and have since been completed but are not yet accruing benefits.

In-Process – Other P/MA’s are In-Process somewhere between Feasibility and Construction/Implementation. All of the In-Process P/MA’s will be implemented except for circumstances such as litigation, failed funding, failed ballot initiatives, or environmental constraints.

As-Needed – As part of the Adaptive Management efforts several P/MAs have been identified in response to Minimum Threshold Exceedances, Failed or diminished P/MA's, new Opportunities, or other unforeseen issues. At each 5-year planning window, these and other P/MAs will be formally evaluated for implementation.

Public Notice Process

23 CCR § 354.44(b)(1)(B)

Public notice requirements vary for the different P/MAs listed above. Some projects' infrastructure improvements may not require specific public noticing (other than that related to construction), whereas other management actions that involve, for example, imposition of fees by the GSA, may require public noticing pursuant to Proposition 218 or Proposition 26. In general, GSA meetings are open to the public. In some instances, the P/MAs will also each be subject to California Environmental Quality Act (CEQA) review and other permitting processes that are subject to public notice and review. Additional stakeholder outreach efforts will be conducted prior to and during P/MA implementation, as required by law.

Overdraft Conditions

23 CCR § 354.44(b)(2)

As discussed in Section 14.1.2 and shown in Table 14-2, the Wheeler-Ridge Maricopa GSA has a minimum target P/MA goal of approximately 18,910 AFY. The P/MAs presented herein are expected to result in benefits that will help avoid Undesirable Results and maintain sustainability.

Permitting and Regulatory Process

23 CCR § 354.44(b)(3)

Permitting and regulatory requirements vary for the different P/MAs depending on whether they are infrastructure projects, recharge projects, demand reduction management actions, and so forth. The various types of permitting and regulatory requirements (not all applicable to every P/MA) include the following, if applicable:

Federal

- National Environmental Policy Act (NEPA) documentation if federal grant funds are used.
- National Pollution Discharge Elimination System (NPDES) stormwater program permit (administered by the California State Water Resources Control Board).

State

- CEQA documentation, including one or more of the following: Initial Study (IS), Categorical Exemption (CE), Negative Declaration (ND), Mitigated Negative Declaration (MND).
- Environmental Impact Report (EIR).
- California State Water Resources Control Board permits and regulations regarding recycled water use, waste discharge, and stormwater capture for recharge.
- California Surface Mining and Reclamation Act (SMARA) regulations.
- California Division of Safety of Dams regulations.

Regional

- San Joaquin Valley Air Pollution Control District (SJVAPCD) permit and regulations.
- Power and Water Resources Pooling Authority (PWRPA).

County/Local

- Encroachment permits – Kern County, local agencies, CalTrans, and others.
- Kern County grading permit.
- Kern County well construction permit.

Specific currently identified permitting and regulatory requirements for each P/MA are listed in Table 3. Upon implementation of any P/MA, the regulatory and permitting requirements of the P/MA will be reexamined.

Status and Implementation Timetable

23 CCR § 354.44(b)(4)

As discussed above in ***Circumstances for Implementation***, P/MAs related to water quantity will be initiated in a manner and sequence that achieves the “Glide Path” level of expected benefits shown in Table 3.

Expected Benefits

23 CCR § 354.44(b)(5)

The P/MAs have expected benefits related to water quantity. Once a P/MA is implemented, there needs to be a way to evaluate, ideally to quantify, the benefits resulting from that P/MA. How P/MA benefits are evaluated/quantified depends on the P/MA type. For those P/MAs that involve direct supply augmentation, the benefit is quantified directly through the measurement of those flows and corresponding response

in water levels. For P/MAs that involve indirect supply augmentation through, for example, increased surface water storage capacity and delivery flexibility, quantification of the benefit will require tracking a comparison of the observed water supply condition (e.g. total imported water) against a hypothetical condition where the P/MA was not in place. For P/MAs that involve water demand reduction, the benefit will be evaluated by comparison of the observed water demand condition (e.g., irrigated acreage) against a hypothetical condition where the P/MA was not in place. Because it is not possible to determine with certainty what the condition without the P/MA would be like, the quantification of the benefits is inherently uncertain.

As discussed above, although the P/MAs described herein are laid out along a general timetable defined by incremental elimination of water budget deficits (i.e., the “Glide Path”), the goals and objectives of P/MA implementation are informed by a water budget outcome with the hope to ensure that Undesirable Results for relevant Sustainability Indicators are avoided by the end of the SGMA implementation period (i.e., by 2040). For this reason, ultimately the success of the collective implementation of P/MAs will be determined by whether the Sustainability Goal is achieved.

Source and Reliability of Water from Outside the Basin

23 CCR § 354.44(b)(6)

Potential water supplies that feed water recharge P/MAs (WRM-1, WRM-2, WRM-3, WRM-4, and WRM-5) could come from the following sources:

Central Valley Project

The Central Valley Project (CVP) is a network of dams, power plants, and canals that provides water supply reliability to the Central Valley in periods of drought. The Bureau of Reclamation makes excess non-storable CVP Section 215 flood water available during wet years. Although WRMWSD does not have a contract for CVP, through transfer agreements, WRMWSD has received CVP water in the past.

State Water Project

DWR delivers water to 29 State Water Contractors, including 21 south of the Sacramento River Delta, that are served from the California Aqueduct. State Water Contractors can order water up to their Table A allocation under a given allocation set by DWR, even if the water is not needed in that year, and this excess water can be stored outside the contractor’s place of service for future use. WRMWSD has a contract for 197,088 AFY of Table A water from the SWP through the Kern County Water Agency (KCWA), one of the State Water Contractors. During wet hydrologic years, DWR may declare Article 21 water available, which is uncontrolled water that cannot be stored in State reservoirs. Article 21 supplies are available in short duration, and, if

conveyance capacity exists, can be purchased, and stored for future use. WRMWSD also purchases excess Article 21 water through its State Water Contractor.

Appropriative Water Rights

Surface water rights, including pre-1914 and post-1914 water rights, are held by water districts and parties throughout California, including Kern River water rights. These water rights can be transferred to other parties as long as legal users of water are not injured (per Water Code Sections 1706 and 1702). The SWRCB supervises changes to post-1914 water rights, but not pre-1914 water rights. Unregulated Kern River flows are available during wet years when the U.S. Army Corps of Engineers (USACE) conducts mandatory releases of water from Isabella Reservoir for flood control purposes. The Kern River Watermaster records the amount of water released daily from the Isabella Reservoir into the Kern River. During these periods of flooding, releases from the Isabella Reservoir may be available for diversion. WRMWSD has received considerable Kern River supplies through transfers from Kern River water right holders.

The Delta Conveyance Project (WRM-4) relies on pursuing a water right permit and/or amendment from the State Water Resources Control Board (SWRCB), which will provide them legal authority to divert water within certain conditions, for a specific purpose, and use within a specified area.

3rd Party Programs

WRMWSD participates in various water banks including: the Kern Water Bank, Pioneer Project, and the Berrenda Mesa Project, along with several Kern County and outside of Kern County agencies. These supplies come from the above three identified sources and have provided drought protection for WRMWSD.

P/MA Annual Water Benefit Estimate for Groundwater Recharge/Storage Projects

Water banking recharge projects have been designed assuming a wet year occurs every 5 years, with a maximum benefit over 100 days. Water supply augmentation benefits have been calculated as follows:

*Annual Water Benefit = estimated infiltration rate ft/day * wetted acres * 100 days operation per year * 20 percent of years being wet.*

Legal Authority Required

23 CCR § 354.44(b)(7)

The WRMWSD is a water storage district, that possesses the legal authority to implement P/MAs discussed herein. As GSAs, per California Water Code (CWC) §

10725 through 10726.8, the Wheeler Ridge-Maricopa GSA possesses the legal authority necessary to implement the demand management P/MAs described herein.

Estimated Costs and Plans to Meet Them

23 CCR § 354.44(b)(8)

Estimated costs for each P/MA are presented in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA. The ongoing costs are associated with O&M and/or costs to otherwise continue implementing a given P/MA. It should be noted that depending on the source and nature of funding for the P/MAs, the one-time costs may or may not be incurred entirely at the beginning of the P/MA; in some instances, loans or other financing options may allow for spreading out of “one-time” costs over time.

Potential sources of funding for the various P/MAs are also presented in Table 4, and include the following:

- WRMWSD funds, generally supported by fees charged to landowners within WRMWSD, including potentially the following:
 - General fund
 - GSA Administrative Charge (implemented in 2024)
 - GSA Pumping Penalties (to be created)
- Grant funding from sources including DWR and others
- Other

Estimated costs for Wheeler-Ridge Maricopa GSA P/MAs by implementation status are summarized in Table 4. The costs are approximate and subject to refinement. These costs include “one-time” costs and ongoing costs. The one-time costs may include capital costs associated with construction, feasibility studies, permitting, environmental (CEQA) compliance, or any other costs required to initiate a given P/MA.

Table 4. (P/MA Cost by Implementation Status)

Wheeler Ridge- Maricopa GSA	Estimated Costs	
	One-time	Annual
Implemented	\$1,200,000	\$4,050,000
Functional	\$0	\$0
In-Process	\$314,225,000	\$205,000
As-Needed	\$18,450,000	\$2,660,000
Total	\$333,875,000	\$6,915,000

Management of Recharge and Groundwater Extractions

23 CCR § 354.44(b)(9)

As discussed above, one primary means by which deficits will be addressed is through implementing P/MAs that reduce demand and augment supplies from additional outside sources of water, particularly during normal to wet years. Many of the projects discussed herein take advantage of additional wet-year supplies that are assumed to be available as capacity increases. These P/MAs include various direct recharge projects and projects that increase storage capacity and delivery flexibility.

In addition to these supply augmentation projects; the portfolio also includes policy-based management actions aimed at demand reduction. Some of these management actions aim to reduce overall water demand through newly implemented water charges, and others are more specifically focused on reducing groundwater pumping by land retirement and imposed water budgets. The formation of an as-needed groundwater budget program (e.g., WRM-9, WRM-10, WRM-11) would likely include mechanisms to allow for trading or exchange of pumping allocations within designated areas, subject to constraints dictated by groundwater conditions observed within the Monitoring Network and policies developed by the respective Board of Directors. Through this combination of increased recharge during wet years and demand reduction, the Wheeler Ridge-Maricopa GSAs' P/MA efforts will ensure that chronic lowering of groundwater levels and reduction in storage during drought will be offset by increases in groundwater levels and storage during other periods.
